The enormous consumption of paper since the war started has created a demand for news print that the pulp and paper mills are trying to keep up with. Last year's production of pulpwood on Crown lands was 131,000 cords, but this year it is expected the output will reach 425,000 cords. A large part of the increase will be due to the activity of the Abitibi pulp and paper mills established in the North under arrangement with the Ontario Government, and now setting down to production in earnest.

The output of spruce, hemlock and other varieties will also be increased. The estimate puts the cut of spruce at 18,000,000 feet, hemlock 27,000,000 feet, and other varieties 39,000,000 feet. The cut under these headings in 1914 amounted to 65,000,000 feet.

## DOMINION TRADE RETURNS.

THE latest Canadian trade returns issued by the Department of Trade and Commerce indicate that the Dominion's trade, although falling off with Great Britain and nearly every other country owing to war conditions, is still rapidly increasing with the United States. The interruption of Atlantic transport since August last has resulted in the diversion to the United States of a considerable amount of Canada's import and export trade.

For the twelve months ending with November last Canada's trade with the United States aggregated $664,335,000, an increase of nearly $48,000,000 as compared with the preceding twelve months. Canada's trade with Britain during the same period totalled $298,496,000, a decrease of nearly $60,000,000 as compared with 1913. Canadian imports from the United States increased during the year by $28,000,000, and exports to the United States by $19,000,000. On the other hand, Canada's imports from Great Britain decreased by $40,000,000, while exports decreased by nearly $20,000,000.

## LOCOMOTIVE WORKS PRESENTATION AND BANQUET.

THE officials and foremen from the various departments of the Canadian Locomotive Co., Kingston, Ont., met recently in the Frontenac Hotel, to pay their respects to Charles J. Goldmark, superintendent engineer, who was about to leave the city for New York. For some years Mr. Goldmark has been connected with the company. G. J. Clark presided and J. Johnson was master of ceremonies, while R. Agnew, master moulder, and W. Kennedy, constituted the guard, both being supplied with batons emblematic of their position.

The banquet was a huge success. After a toast to "The King," American Consul Felix S. S. Johnson responded to the toast of "The President of the United States," which had been proposed by G. J. Johnston. The former spoke of the good feeling existing between the two countries.

The presentation to Mr. Goldmark took the form of a loving cup, which

was turned out in the pattern shop of the locomotive works. The cup was made of pine and mounted on a ten-inch base and coated with aluminum. Messrs. Agnew and Kennedy carried the cup into the dining room and Dr. J. J. Harty made the presentation.

Mr. Goldmark made an eloquent reply to the address also tendered him, and expressed his appreciation of the gift.

A toast to "The Canadian Locomotive Company" was proposed by L. Wood and responded to by William Casey, sales manager. W. Kennedy and George Driver favored the gathering with songs for which they were heartily encored.

Several officers of the 21st Overseas Battalion were guests of the evening, and G. J. Clark proposed a toast to them and their comrades. This was responded to by Lieut. W. K. Macnee.

C. Hayes, assistant foreman of the pattern shop, J. Fleming, W. Kennedy, George Driver and L. N. Marchand contributed to the musical feature of the function.

## TO ENTER ATLANTIC TRADE.

OWING to the fact that prospects are for light carrying business on the Canadian waterways during the coming summer, the Canadian Steamship Lines, Ltd., is making arrangements to transfer some of its largest boats to Atlantic routes. The opportunity is an obvious one on account of the tying up of Germany's merchant marine, and also on account of the large number of craft which have been commandeered by the British Government.

It is understood that there are about ten grain carriers of sufficient size to enter the Atlantic trade. There is also a very favorable feature in that ocean rates have increased to a large extent since the opening of the war and there is certain to be a strong demand for Canadian grain.

President Carruthers states: "As the ocean freight rates are quite high, they are very tempting to us. We have many boats capable of carrying ocean-going cargoes of grain and flour and all of these will be used for this purpose as soon as the lakes and canals are sufficiently clear of ice to permit of their being brought to Montreal harbor. We have all the room booked in our boats for May shipment and many more offers for May-June cargoes.

"Our boats will return to the lakes in the fall when the new crop begins to to come down."

**Galt, Ont.**—The annual meeting of the Board of Trade was held on Feb. 9. and the following officers were elected: Hon. President, F. S. Scott, M.P.; president, C. E. Dowler; vice-president, W. W. Wilkinson; treasurer, W. Phillips; secretary, J. H. Hancock; council, G. A. Dobbie, G. E. Turnbull, J. H. Fryer, J. Sloan, A. M. Edwards, F. S. Jarvis, J. H. Stauffer and T. Vair.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

## CANADIAN TRADE COMMISSIONERS

**Argentine Republic.**

H. R. Poussette, 278 Balcarce, Buenos Aires. Cable Address, Canadian.

**Australasia.**

D. H. Ross, Stock Exchange Building, Melbourne, Cable address, Cancoma.

**British West Indies.**

E. H. S. Flood, Bridgetown, Barbados, agent also for the Bermudas and British Guiana. Cable address, Canadian.

**China.**

J. W. Ross, 6 Kiukiang Road, Shanghai. Cable Address Cancoma.

**Cuba.**

Acting Trade Commissioner, Lonja del Comercio, Apartado 1290, Havana. Cable address, Cantracom.

**France.**

Phillipe Roy, Commissioner General, 17 and 19 Boulevard des Capucines, Paris. Cable address, Stadacona.

**Japan.**

G. B. Johnson, P.O. Box 109, Yokohama. Cable Address, Canadian.

**Holland.**

J. T. Lithgow, Zuidblaak, 26, Rotterdam. Cable address, Watermill.

**Newfoundland.**

W. B. Nicholson, Bank of Montreal Building, Water Street, St. John's. Cable address, Canadian.

**New Zealand.**

W. A. Beddoe, Union Buildings, Customs Street, Auckland. Cable address, Canadian.

**South Africa.**

W. J. Egan, Norwich Union Buildings, Cape Town. Cable address, Cantracom.

**United Kingdom.**

E. de B. Arnaud, Sun Building, Clare Street, Bristol. Cable address, Canadian.

J. E. Ray, Central House, Birmingham. Cable address, Canadian.

Acting Trade Commissioner, North British Building, East Parade, Leeds. Cable address, Canadian.

F. A. C. Bickerdike, Canada Chambers, 36 Spring Gardens, Manchester. Cable address, Cantracom.

Fred. Dane, 87 Union Street, Glasgow, Scotland. Cable address, Canacom.

Harrison Watson, 72 Basinghall Street, London, E.C., England. Cable address, Sleighing, London.

## CANADIAN COMMERCIAL AGENTS.

**British West Indies.**

Edgar Tripp, Port of Spain, Trinidad. Cable address, Canadian.

R. H. Curry, Nassau, Bahamas.

**Colombia.**

A. E. Beckwith, c-o Tracey Hmos, Medellin, Colombia. Cables to Marmato, Colombia. Cable address, Canadian.

**Norway and Denmark.**

C. E. Sontum, Grubbeged No. 4, Christiana, Norway. Cable address, Sontums.

**South Africa.**

D. M. McKibbin, Parker, Wood & Co., Buildings, P.O. Box 559, Johannesburg.

E. J. Wilkinson, Durban, 41 St. Andrew's Buildings, Durban, Natal.

## CANADIAN HIGH COMMISSIONER'S OFFICE.

**United Kingdom.**

W. L. Griffith, Secretary, 17 Victoria Street, London, S.W., England.

# INDUSTRIAL AND CONSTRUCTION NEWS

**Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.**

## Engineering

**Coaticook, Que.**—Sleeper & Akhurst, Ltd., have received an order for shells.

**London, Ont.**—The City Council are in the market for machine tools for the works department.

**London, Ont.**—The city contemplate purchasing pumps and motors. H. A. Braizier, city engineer.

**Bassano, Alta.**—The town council are considering the purchase of a turbine pump and cast iron piping.

**Stratford, Ont.** — Time recording clocks are required by the School Board. A vacuum cleaner is also required.

**Hamilton, Ont.**—Turbine pumps and motors will be required shortly for the new pumping station. A. F. Macallum, city engineer.

**Hamilton, Ont.**—The National Machinery Co., has received a contract for shells from the British Government amounting to $125,000.

**Lindsay, Ont.**—The Sylvester Mfg. Co., propose to erect an addition to their plant and equip same with the latest machinery for making gasoline and oil engines.

**Quebec, Que.**—It is rumored that the proprietors of the Ross Rifle Co., intend to acquire the Paquet factory at Hare Point for the purpose of establishing in that locality the new factory needed to fulfill the order for three million rifles which the company recently obtained from Russia.

**Fort Erie, Ont.**—A branch of the Curtiss Aeroplane Co., which has its main office and works at Hammondsport, N. Y., has been established in Fort Erie. The company are making some of the parts of aeroplanes, while other parts will be imported and the assembling done here. N. S. Hopkins is manager.

## Electrical

**Dutton, Ont**—A by-law is contemplated to raise $10,000 for the installation of a Hydro-electric power system.

**Newmarket, Ont.**—The Metropolitan by-laws will be submitted on Feb. 22. It is proposed to spend $15,000 on transformers and extension to the town system.

**Niagara Falls, Ont.**—If the present route for the proposed new power canal from the Chippewa creek to Queenston, where the Ontario Hydro-Electric Commission plans to construct a generating station, is followed, a tunnel nearly a mile in length will have to be constructed under Lundy's Lane, according to an engineer connected with the Hydro-Electric staff. This will cost more than $200,000, it is estimated, and will take a year to construct.

## Municipal

**Huntsville, Ont.**—The council propose making extensions to the electric lighting system.

**Hull, Que.**—The city council are considering the purchase of a steam pump for the fire department.

**Hamilton, Ont.**—It is proposed to spend $100,000 on a fire alarm system. A by-law will be submitted to the ratepayers.

**Winnipeg, Man.**—The contract for additional improvements to the municipal hospital heating plant has been approved.

**Winnipeg, Man.**—Superintendent of Waterworks Hooper asked authority to purchase water meters required at a cost of $234.

**Montreal, Que.**—Plans are being prepared for the proposed tunnel under the Lachine Canal on Wellington street. Paul Seurot is consulting engineer.

**Hamilton, Ont.**—The City Council are in the market for equipment for the fire department consisting of a motor hook and ladder truck, and motor pumping truck.

**Brockville, Ont.**—A committee has been formed to secure tenders for a new intake pipe and to obtain expert advice on a filtration plant. G. H. Bryson is town engineer.

**Lindsay, Ont.**—A by-law will be voted on by the ratepayers on March 3 to authorize a guarantee of bonds to the amount of $30,000 to the Boving & Co., of Canada, Ltd.

**St. Mary's, Ont.**—The proposals submitted by the water and light commission to the town council have been approved by that body. The proposals cover the installation of a gasoline engine at a cost of $4,000, and a new street lighting system to cost $8,555.

**Toronto, Ont.**—The Board of Works has requested Works Commissioner Harris to insert $345,000 in his estimates to cover the cost of a bridge across the ravine at Moor Park. This will be the means of continuing St. Clair avenue east and west in a direct line.

**Aylmer, Ont.**—At a joint meeting of the town council and the Board of Trade it was decided to submit to a vote of the people both propositions now before the public—the hydro radial, the road from London via Westminster and Belmont, and the Traction line from St. Thomas.

**Brockville, Ont.**—In the investigation being conducted into the quality of the water supply as a suspected cause, a diver of the Donnelly Wrecking Co. has located a big break in the intake pipe on the river bed, through which sewage contamination is thought to have found its way.

**Montreal, Que.**—The Board of Control has decided to ask council for $39,500 for cables and electric light standards to be placed on St. Catherine Street, between Atwater and Papineau Avenues from Craig Street to Pine Avenue. If this amount be voted, tenders for the work will be called at once.

**London, Ont.**—Between four and five million feet of gas per day is the estimated output of a well that has been struck in the village of Delaware, a few miles from here. This is considered sufficient to supply the entire city of London. The well is owned by a London and Petrolea syndicate, which has leases on more than 40,000 acres in the district.

**Toronto, Ont.**—The Works Commissioner has reported to the Board of Control in favor of accepting the tender of the Merrill & Ruckgaber Co., for the construction of section two of the high level interceptor at a cost of $65,300. The appropriation for the work originally made by the Works Commissioner was only $25,000.

**Winnipeg, Man**—Close on a million dollars will be saved to the Greater Winnipeg water district by the discovery of an easier route for the Shoal Lake aqueduct than the one originally mapped out. James H. Fuertes, of New York, consulting engineer to the district, thinks that the big undertaking will be finished

within the estimated cost and within the estimated time, and backed up his prediction with the encouraging information given above. He has just returned from one of his periodical trips over the route of the aqueduct.

# General Industrial

**Redcliff, Alta**—A proposition is being considered by a Calgary syndicate to establish a 200-barrel flour mill here to cost $20,000.

**Port Arthur, Ont.**—It is announced that work on the Canadian Northern coal and ore docks will begin shortly. Barnett & McQueen Co., are the contractors.

**Windsor, N.S.** — H. C. Burchell, of Sidney, N.S., is interested in a company who propose establishing a plant here for quarrying and milling limestone and shale to make a fertilizer.

**Coppercliff, Ont.**—It has just been announced that the Canadian Copper Co., the largest producer of nickel in this district, will immediately reopen its No. 2 mine here, also the Crean Hall mine.

**Vancouver, B.C.**—Ramsay Bros. & Co., have acquired the chocolate plant of the Pacific Chocolate Co., of New Westminster, and will move and install it in their present commodious building on Powell Street.

**Petrolia, Ont.**—A charter has been secured under the Ontario Companies' Act, under the name of Petrolia Flour Mills, Ltd., with an authorized capital of $40,000. F. S. Brown, of Toronto, is interested.

# Trade Gossip

**Toronto, Ont.**—Schofield-Holden Co. has taken out a five-year lease of No. 415 to 419 King street west for $15,000.

**The Mechanical Engineering Co,.** have moved their office and works from 129 Mill street, to 55 Cote street, Montreal.

**Army Enamelware Orders.**—Superintendent Grampp of the Stamped Enamelware Works, Hespeler, Ont., has secured a large order for granite plates, cups, bowls and water bottles.

**London, Ont.**—The arrangement between the City Council and Board of Trade, by which Gordon Phillips is appointed as Industrial Commissioner, was reaffirmed on Feb. 15, by City Council.

**Summerside, P.E.I.** — Neil McLeod brought up before the Board of Trade the matter of appointing an industrial commissioner to represent this province in Boston or some of the large centres of the United States.

**The Berg Machinery Mfg. Co.,** of Toronto, are endeavoring to sell their plant consisting of boiler, machine, foundry and pattern shops, etc. J. P. Langley & Co., McKinnon Bldg., Toronto, are the assignees.

**Oshawa, Ont**—The election of officers for the Board of Trade resulted as follows:—President, Col. J. F. Grierson; vice-president, J. W. Provon; sec.-treas., D. A. J. Swanson; council, J. F. Tamblyn, T. B. Mitchell, J. Stacey, H. B. Samells, A. S. McLeese, W. L. Law.

**Maritime Province Shell Production.**—Ae present the Nova Scotia Steel & Coal Co. and Nova Scotia Car Co. plants are turning out a large number of rough shells daily and finishing equipment for same is being rapidly installed. Similar provision is being made at the Eastern Car Co. and McNeil shops.

**ALLIES PURCHASING AGENTS.**

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**British—Col. A. G. Barton and A. C. Billing, Ritz Carlton Hotel, Montreal.**

**French—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.**

**Russian — Messrs. S. Ruperti and Aiekieff, care Military Attache, Russian Embassy, Washington, D.C.**

**Car Order Rumor.**—The story is prevalent that the officials of the Eastern Car Co. are figuring on an order for fifteen thousand cars for the Russian government. At present two representatives of the New Glasgow concern are in Russia looking for orders, and it may be they have run across this find.

**Berlin, Ont.**—Notwithstanding a decrease of more than $4,000 in receipts last year, the Berlin & Waterloo Street Railway, owned by the city, reports a net profit of $405.70 for 1914. Total receipts amounted to $72,973.69. Seventy-five per cent. of the profits will be paid to the Berlin treasury and the balance to Waterloo.

**Brandon, Man.**—At the annual meeting of the Board of Trade the election of officers resulted as follows: President, A. Shewan; vice-president, O. L. Harwood; secretary, Clarence King; directors, J. Cornell, A. E. Evans, J. Howard Rankin, J. S. Wilmott, A. E. McKenzie, A. D. Rankin, J. H. Hughes, J. S. Maxwell, A. A. Evans, K. Campbell, P. Kennedy and C. L. Cummings.

**Fredericton, N.B.**—The Publicity Committee, comprising five members of the Board of Trade and five members of the City Council, met recently in the Board of Trade rooms and organized for the year. C. Fred Chestnut is to continue as chairman and Ald. Lemont, treasurer of the Board of Trade, will act as treasurer of the committee.

**Prince Albert, Sask.**—The annual meeting of the Board of Trade was held on Feb. 5, and the following officers were elected: President, T. J. Agnew; vice-president, R. H. Hall. Executive Committee—J. W. Garrett, C. F. Clare, P. W. Mahon, H. Sibbald, A. L. Mattes, B. W. Wallace, T. Williams, J. E. Bradshaw, W. D. Mitchell, J. B. Kernaghan, A. E. Fox, J. Sinclair, J. F. Evans and T. B. Sharpe.

**$650 for Leaky Roof.**—The Canada Malleable Iron Co. Owen Sound, Ont., sued for $5,000 for a faulty roof put on its new buildings. It was said that the machinery installed was ruined by leaks. Mr. Justice Britton has given judgment for $500 against the Asbestos Mfg. Co. of Montreal, who supplied the material, and against Creeper & Griffin of Owen Sound, for $150 for faulty workmanship.

**Installing New Shell-Making Machinery**—New machinery, consisting of nine turret lathers, is being installed by the Canadian Locomotive Co., Kingston, Ont., for the purpose of machining shrapnel shells. At present the Canadian Government is supplying the forged shells ready for machining, but it is reported that the local firm is about to purchase equipment to do the forging as well.

**Army Wagons**—A sample of the new army wagon, built for the Canadian Government by the Tudhope-Anderson Co., Orillia, Ont., has been on exhibition at Messrs. E. F. Cooke & Son's warerooms. It is a particularly strong vehicle, weighing 1,600 pounds, with three-inch tires, and has numerous fittings not found on the ordinary wagon. It is rumored there is prospect of further orders for war wagons.

**Poisoned Shells.**—Sir William Ramsay states on the authority of an eminent French chemist that the German high-explosive and shrapnel shells contain mixed with their charge a considerable proportion of a compound of phosphorus.

The bullets of the shrapnel have been roughened, apparently intentionally, in order to convey this phosphorus to the wounds. Phosphorus conduces to mortification and favors the growth of tetanus bacilli.

**Canada Car Co. War Orders** — In moving the adoption of the report at the recent annual meeting, Senator Curry said he was sorry that the report was not a better one, but under the circumstances and considering business conditions generally he thought they should feel well satisfied with the showing. Reference was made to war orders aggregating about $2,000,000 which the company now had and still larger ones were looked forward to.

**Ross Rifle Co. Orders**—The Ross Rifle Co. is one of the principal beneficiaries of the war. The official memorandum shows that an official order was given for thirty thousand rifles, a second for twenty thousand, and it is understood a third is being placed for a similar number. The price paid is $26.90 for each rifle without screw elevating sights. The sights cost $1.10 each, bayonets $5.22, and rifle chest $8.25. The total order so far is thus around $2,800,000.

**Quebec, Que.**—The Board of Trade at its annual meeting re-elected its retiring officers as follows:—President, Jos. Picard; vice-presidents, J. G. Scott and O. W. Bedard; treasurer, W. J. Banks; secretary T. LeVasseur. Board of Arbitration—Sir Geo. Garneau, Hon. Geo. E. Amyot, M.L.C., Sir. Wm. Price, Messrs. John T. Ross, Wm. Power, M.P., Naz. Fortier, Gasnard Lemoine, W. M. Macpherson, T. T. Martineau, Jos. Winfield, M. Joseph and G. A. Vandry.

**Saddlery Orders.**—A $250,000 contract for the manufacture of saddlery and other leather equipment for the French Government has been awarded to J. E. Edwards & Sons, leather goods manufacturers, Christie street, near St. Clair avenue, and branch offices at 56 Colborne street, Toronto. The staff at the Edwards factory has been practically doubled, and it is expected that the French contract, with other work on hand, will keep all employed till the end of May. The Edwards factory is one of the chief industries of the Bracondale-Wychwood district.

**Medicine Hat, Alta.**—The newly elected officers of the Board of Trade are:—President, R. P. Stewart, manager of the Alberta Clay Products Company; vice-president, George E. Armstrong, manager of Ogilvie Flour Mills; secretary, S. E. McClennan. Executive Council—R. H. Kent, J. H. Taber, A. J. Matthews, E. Berrhein, H. H. Brown, E. W. Stancy, Dr. W. H. MacDonald, Dr. Woodland, W. Rutherford, A. J. Lepage, G. W. Elliott, I. Bullivant, H. Shardlow, A. McPherson, R. B. Davidson, W. J. Nesbitt, J. E. Davies, W. G. Lynch, T. Bell, F. N. Smith.

**Nova Scotia Car Co.**—At the annual meeting of the Nova Scotia Car Works Ltd., it was stated that the company has urgent claims from creditors and no liquid capital, so that it cannot execute orders which are available. Some 80 per cent. of the creditors have consented to an extension of nine months, and banking assistance can be secured if 90 per cent. of the creditors will agree to the extension. No creditor is to get any preference, and if the company goes into liquidation it will be at the instance of the company and creditors alike. The report showed $61,391 in bills payable, and $54,500 due the bank.

**The Turbine Equipment Co.**, of Toronto, have been awarded , by the Ver Mehr Engineering Co., a further contract for one 1,800 h.p. De Laval multi-stage steam turbine, which will be connected through the medium of De Laval double helical reduction gears to one 1,200 k.w. 90 per cent. p.f., 3-phase, 25-cycle, 2,200-volt, 500 r.p.m. alternator of the Lancashire Dynamo & Motor Co. make. The steam turbine will operate at a speed of 3,600 r.p.m., and the gear ratio will, therefore, be approximately 7.2 to 1. The contract calls for complete installation at the Toronto Island filtration plant, along with a C. H. Wheeler parallel flow jet condenser, with centrifugal removal pumps and Thyssen centrifugal air pump.

**Patent Suit Decision.**—The patent suit brought against the B. F. Sturtevant Co. of Boston by the Sirocco Engineering Co., which has been in the courts for the past six years, has just been decided by the United States Circuit Court of Appeals for the second circuit, in favor of the Sturtevant Company. It was claimed that the Sturtevant multivane fan infringed the Sirocco Co.'s patents, and in the Lower Court this claim was sustained. The Court of Appeals, however, reversed the former decision and held that there was no infringement. The Court of Appeals further decided that the Sirocco patents in suit were void in view of the development of the fan-building art prior to the alleged inventions upon which these patents were based.

**Making Shells at Midland, Ont.**—The plant at Midland formerly known as the Georgian Bay Engineering Works, and which has been standing idle for nearly fifteen months, has been leased by Drummond Bros., who will fit it up for the manufacture of shrapnel shells. The special machinery has already been purchased and will probably be installed in the course of a month. It is expected sixty men will be employed when the plant is in operation. Of these sixty a considerable number will require to be skilled mechanics, and in all probability will be brought in from outside; but the firm will employ Midland labor as far as possible. The business will be under the management of J. J. Drummond, and the firm name will be that of "The Zenith Co. of Montreal," with Drummond Bros. sole shareholders.

**Wanted $2,000,000 Profit.**—The Carbon Steel Co., of Pittsburgh, on Feb. 15 refused, it is reported, a $4,000,000 war contract to manufacture 1,000,000 three-inch shells for the British Government. The reason is said to be that a big steel broker in Montreal tried to make a $2,000,000 profit on the contract. The Carbon Steel Co. had tentatively agreed to take the contract at this price, when it was ascertained that the Canadian contractor was to get $6 each for the shells. This attempt to "scalp" $2,000,000 angered the Pittsburgh people and they withdrew from the transaction. Some unpleasant exposures of the methods of certain Canadian manufacturers and war supply brokers is threatened. The attempt of this particular beneficiary of the British Government would probably have succeeded but for President Charles McKnight, of the Carbon Steel Co. He returned from England only a few days ago, and while in London got some information as to the contract. He knew to whom it went and the price the British War Office had agreed to pay for the shells. When he arrived in Pittsburgh in Wednesday and was informed of the contract his concern had undertaken, some sharp telegrams were exchanged, with the result that the contract was canceled

## Personal

**Wm. M. Weir**, of Montreal, has been elected president of the Canada Foundries & Forgings Co., Ltd., Brockville, Ont., in succession to John McGill, resigned.

**J. P. Cotter**, manager of the Canadian Ingersoll Rand Co. for the Maritime Provinces and Newfoundland, has returned to Sidney, C.B., from a business trip.

**C. Hamilton-Wickes**, His Majesty's Trade Commissioner to Canada and Newfoundland, left Montreal on Feb. 3, by the Maritime Express, en route to the United Kingdom.

**D. Lorne McGibbon** has resigned the presidency of the Canadian Consolidated Rubber Co., of Montreal, in order to de-

vote more time to the affairs of the Ames-Holden-McCready Co.

**C. R. Burt,** for the past year and a half factory manager of the Russell Motor Car Co., Toronto, has been appointed assistant general manager and elected to the directorship made vacant by the resignation of Mr. J. E. Rogers. The appointment is effective at once.

**James Crawford,** of Belfast, Ireland, who has been in Canada looking for supplies of flax fibre for Irish linen mills, says that the growing of flax should prove a profitable business in Ontario.

**J. L. Pollock,** at one time sales manager of the Stuart Machinery Co., and more recently president and manager of the Alberta Rolling Mills, Medicine Hat, will return to the Stuart Machinery Co. as manager.

**H. E. Gainsworth,** advertising manager of the Wm. B. Pierce Co., of Buffalo, N.Y., has resigned his position to accept the advertising and sales directorship of the General Specialty Co., Buffalo, N.Y.

**Frederick W. Stobart,** who has represented the British War Office as purchasing agent in Canada since last fall, has resigned from that office and left for his home in England. A. C. Billing, managing director of Stobarts, Limited, of Winnipeg, succeeds Mr. Stobart. Mr. Billing, has been associated in the work of purchasing supplies in Canada since the establishment here of a branch purchasing office of the Imperial Government.

**W. G. McIntosh, B.A.Sc.,** has recently been appointed sales-engineer for Toronto by the Herbert Morris Crane and Hoist Co., Ltd. Mr. McIntosh is an honor graduate in mechanical engineering of the University of Toronto, and has had considerable office, shop and field experience, having been formerly connected with the Otis-Fensom Elevator Co., the Toronto Power Co., the Canada Foundry Co., and the Dominion Bridge Company.

# Tenders

**Toronto, Ont.**—The Board of Control has extended the time for receiving tenders for the new incinerator, to be located on the Don Esplanade, south of Gerrard Street, until Feb. 23.

**Thornbury, Ont.**—Tenders will be received up to February 25 for work, material, plumbing, heating and ventilating and excavating for new addition and remodelling the Thornbury Public School. Plans and specifications may be had from T. G. Idle.

**Windsor, Ont.**—The City of Windsor has for sale and invites tenders for the purchase of machinery and electrical apparatus, consisting of engines, boilers, heaters, steam pumps, shaft, pulleys, belts, generators, arc lamps, switchboard, quantity of copper wire, etc. Complete specifications may be obtained by application to undersigned by whom tenders will be received up till Tuesday, March 2nd. M. A. Dickinson, Acting Clerk.

**Ottawa, Ont.**—Tenders will be received by R. C. Desrochers, secretary of the Department of Public Works, Ottawa, until March 1st, for the following supplies for Departmental dredging plants in Nova Scotia and New Brunswick: Brooms and brushes, chain, hardware, hose, oils and greases, packing, paint, paint oils, etc., manilla rope, wire rope, steam pipe, valves and fittings. Specification, etc., at the offices of J. K. Blenkinsop, Supt. of Dredges, St. John, N.B., and the Department of Public Works, Ottawa.

**CAPTURING GERMAN TRADE.**

**A great deal has been written of late as to "capturing" enemies' trade—much of it sense, but still more of it nonsense. Many dilettante commercial experts, who have probably never been inside a factory and who have no practical knowledge of how trade and industry are financed and conducted, freely lavish allegations as to lack of initiative and out-of-date methods on the part of our manufacturers and exporters, and airily discuss the "capture" of the export trade of Germany and Austria-Hungary, valued at over six hundred millions sterling per annum. We have no desire to discourage energy and enterprise in making the most of every opportunity for extending our trade—far from it—nor is it denied that in some directions our methods of business are capable of improvement, but to spread broadcast throughout the world the idea that our trade and industry is conducted on out-of-date principles is not only untrue, but is calculated to defeat the object which, presumably, such critics have in view. Up to now it has not been possible to do a great deal more than to survey the field and to pave the way for strenuous competition at the right moment, and much assistance in this direction has been afforded by the British Board of Trade, the London Chamber of Commerce and the Department of Trade and Commerce, Ottawa.**

**Ottawa, Ont.**—Tenders will be received until Thursday, February 25, 1915, for the installation of one (1) standard passenger elevator, and one motor generator set to supply current for elevator, in the examining warehouse, Fort William, Ont. Plans, specifications and form of contract can be seen and forms of tender obtained on application to the department of public works, Ottawa, at the offices of Thos. A. Hastings, clerk of works, Postal Station "F," Toronto, Ont., and to J. C. Stinson, architect, Fort William, Ont.

**Hamilton, Ont**—Sealed tenders will be received by the chairman Board of Control, City Hall, up to Monday, March 1st, 1915, for the supply of the following material and equipment:—Castings, (ordinary and special) iron pipe, hydrants, valves, extension boxes, hardware, lead pipe, pig lead, rubber hose, rubber boots, road oil, flux, fuel oil, coal oil, gasoline, concrete and garbage duck covers, brass brooms and sectional sweepers, brass work for water department, sewer brick. Specifications can be obtained at the office of the secretary of the Works Department. S. H. Kent, City Clerk.

**Toronto, Ont.**—The undersigned has been instructed to offer for sale the following:—

Parcel I.—The steamers "Meteor," "Temiskaming" and "Jubilee," with their equipment, the hull of the launch "Kiask," five scows, certain wharf properties, freight sheds and shipway at points on Lake Temiskaming and certain miscellaneous equipment, the whole being the property of the Temiskaming Navigation Company, Limited; and

Parcel II.—The steamer "Silverland" and her equipment, being the property of the Haileybury Navigation Company, Limited.

Tenders for the above will be received by the undersigned up to noon of Wednesday, the 10th March, 1915. James Hardy, assignee for benefit of creditors of Temiskaming Navigation Co., 15½ Toronto Street, Toronto, Ont.

# Contracts Awarded

**Ottawa, Ont.**—The Dominion Bridge Co., Ltd., has been awarded the contract for a number of traveling cranes for the N. T. R. Locomotive and Car shops at Quebec.

**Winnipeg, Man.**—The contract for an engine shed for the Greater Winnipeg Water District line at Deacon, has been awarded to the Progress Construction Co., at $3,997.

**Winnipeg, Man.**—Hadden & Co. have received a large clothing contract from the British Government, consisting of six thousand tunics and an equivalent number of trousers.

**Hamilton, Ont.**—Tenders from the Otis Elevator Co., for elevators for the main building of the City Hospital, as a cost of $7,500, were accepted, and also for the Canadian Oil Co., for lubricating oils.

**Winnipeg, Man.**—The following contracts have been awarded by the Greater Winnipeg Water District:—Canadian-Fairbanks Morse Co., four 15,000 gallon tanks, three pumps and engines, all erected, $7,490.77; Watrous Engine Works, Brantford, rock crushers, $1,220; Vulcan Iron Works, Winnipeg, revolving screen, $1,071; Manitoba Bridge & Iron Works, three elevators, $1,373; Stewart Machinery Co., three conveyors, $1,023; City of Winnipeg, for a 100-125 h.p. steam engine steam boiler with stack, steam feed pump with accessories for boiler, $1,894; also deep well pump, $141; Browning Co., Winnipeg, portable crane excavator, $7,427; Montreal Locomotive Works, four locomotives, $43,000.

## Building Notes

**Toronto, Ont.**, Malvern high school is to be enlarged at a cost of $70,000.

**Hamilton, Ont.**—Land has been purchased at a cost of $7,000 for the building of a labor temple here.

**Berlin, Ont.**—An addition is to be erected to the Berlin Public Library this year at a cost of approximately $20,000.

**Toronto, Ont.**—The new Jarvis Collegiate, for which plans and estimates are under preparation, will cost in the neighborhood of $300,000.

**Toronto, Ont.**—Plans are being prepared for the proposed central courts building which will also be police headquarters. It will probably cost over $750,000.

**Toronto, Ont.**—It is proposed to add three stories to the old Board of Trade Building, and reconstruct the interior. In the future it will be known as the Transportation Building.

**Toronto, Ont.**—The Butterick Publishing Co., of New York, will build a factory on Wellington Street, near Spadina, at an estimated cost of $100,000. L. S. Yolles is the architect.

**Chatham, Ont.**—The plans and specifications for the new sub-station for the hydro distributing system, to be erected on King Street, have arrived here from Toronto, and tenders will be called at once.

**Toronto, Ont.** — Estimates totaling $355,000 for high school buildings were adopted. The chief item was $250,000 for a Central Collegiate Institute, to be erected on the north side of East Bloor street.

**Toronto, Ont.**—Tenders have been received by the Ontario Hydro-Electric Power Commission, Continental Life Building, Bay street, for a station and office building to be erected by the Public Utilities of Chatham, Ont.

**Toronto, Ont.**—Building estimates aggregating $1,615,000 for high and public schools have been presented by Superintendent Bishop to the Property Committee of the Board of Education, and were given general approval. They will have to pass the Finance Committee of the board.

**Montreal, Que.**—Tenders for the construction of the civic library, to be built on Sherbrooke St. East, between Montcalm and Beaudry Streets, are to be called at once, in accordance with a resolution of the Board of Control passed on January 30. All tenders must be submitted by February 25. Mr. Payette is the architect.

**Guelph, Ont.**—Tanner & Tanner, architects, have completed plans of a new garage building for J. H. Johnston, of this city. It will be one storey, situated on the south side of Cork Street, and will have foundations of sufficient strength to carry two additional storeys at any future time. This garage will have a floor area of six thousand square feet.

## Railways-Bridges

**Toronto, Ont.**—Work in connection with the Bloor street viaduct has been commenced.

**Uxbridge, Ont.**—It is now certain that the ratepayers of this township will be given the opportunity within a comparatively short time to vote again on Sir Adam Beck's scheme of hydro radials.

**Niagara Falls, Ont.** — Alexander Fraser, of this town, has given notice that he will apply for the incorporation of the Ontario Niagara Connecting Bridge Co. with power to build a bridge over the Niagara River.

**Toronto, Ont.**—Works Commissioner Harris now estimates that the cost of the St. Clair avenue bridge to extend that street in a straight line to Moore Park will cost $345,000, ten thousand dollars more than last year's estimates.

**Toronto, Ont.**—The Board of Control have decided to ask the Legislature to compel the Toronto Street Railway to carry out the recommendations of the Barnes report. The extensions and equipment suggested would cost the company $2,000,000.

**Ottawa, Ont.**—R. A. Pringle, in his report, states that the true, actual and proper cost of the construction of the Southampton Railway was $202,565, or $15,950 per mile instead of $291,517, or $22,954 per mile, as certified by E. V. Johnson, inspector engineer.

**Three Rivers, Que.**—The voting on January 25, relative to the franchise of twenty years to the Three Rivers Traction Co., resulted in a majority of four hundred and six votes in favor of granting the franchise. Three Rivers will, therefore, have a trolley line in the near future.

**Hamilton, Ont.**—The civic officials have decided to apply to the Ontario Railway Board for an order compelling the Street Railway Co. to build the two cross-town lines proposed, renew its York Street and West King Street tracks, and better its service unless the company officials decide to meet the demands of the city in the matter.

**Ottawa, Ont.**—The Simcoe, Grey and Bruce Railway Co. will apply to Parliament for an Act extending the time within which to commence the construction of the railway and expend 15 per cent. of capital stock for two years, and for permission to complete the railway and put it in operation within five years after the passing of the Act .

**Toronto, Ont.**—The Ontario Railway and Municipal Board has extended the time to July to the Toronto Street Railway for the reconstruction of the 13.6 miles of track ordered some time ago by the board. Application failed, however, to get more time for the fifty new cars which were ordered for June 1, and the Ossington avenue extension.

**Widen Montreal Tunnel.**—Sir Donald Mann, vice-president of the C. N. R., states that the tunnel under Mount Royal in Montreal will be extended to its full two-track width from Mount Royal down to the Dorchester Street station site by the end of April next, at the present rate of progress. Sir Donald expects to have the station completed during the summer or the early autumn.

**Ottawa, Ont.**—In a statement given out after its anual meeting, the Ottawa Traction Co. (Ottawa Electric Railway) announces gross earnings for the year as $1,096,459. The number of passengers carried was 25,321,547, an increase of 1,333,664 over the preceding year. The

Canada's Leading Machinery House

## HOLDEN-MORGAN'S
# Shell Marking Machine

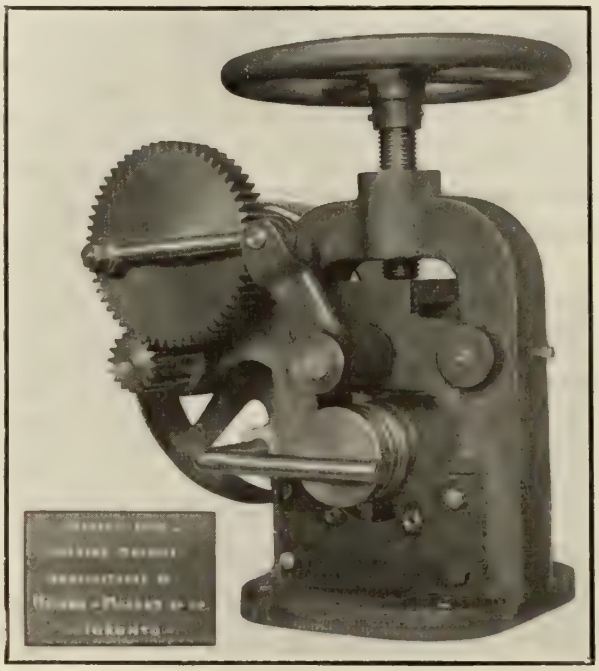
Compact and accurate, does not require skilled labor, gives proper depth of impression and will not distort shell. Takes care of variation in diameter. Marks shell in 5 to 10 seconds.

Price $135.00 F.O.B. Toronto.
Delivery 10 days to 2 weeks.

Price includes marking wheel with the following letters:

**Q. F. 18 Pr.**
**III**
**F.S.**
**(MAKER'S INITIALS)**
**DATE, NO. OF MONTH, YEAR**

Two sets of figures included—0-12 and 1-9, marking month and date—for series No. 2, sets letters cost $6.50 per set extra. Additional figures $3.00 per set (figures and letters can be changed in about five minutes.) Largest shell manufacturers now using this machine. Mail us your order.



## WE OFFER YOU ANOTHER TIME-SAVER—

# The Hamilton Double-Ended Facing and Cutting-off Machine

Cuts off open end of shells and faces closed end in one minute to one minute and one-half; **"one chucking"** shell is located from stop on inside of base or powder chamber.

Special six cam chuck, positive grip. Jaws of tool steel and operate in tool steel bearings.

Spur gears are of steel with exception of large gear. All gears guarded, completely enclosed and well lubricated. Geared pump, with reservoir in base of machine, supplies liberal amount of fluid to each cutter.

Automatic stop with four to one return.

Standard high-speed steel bars. No specially forged tools.

**Send us your order. This is a real time-saver and a well-made machine. Price $450.00 f.o.b. Toronto—Delivery two weeks.**

**We also supply complete set of gauges and other special equipment.**

amount of net earnings and dividends is not disclosed. The directorate was re-elected, with T. Ahearn as president and W. Y. Soper as vice-president.

**Ottawa, Ont**—According to the annual report of the Transcontinental Railway Commission presented by Hon. Frank Cochrane on Feb. 8, the total expenditure on the road to the end of the last fiscal year was $142,867,999, exclusive of interest and the cost of the Quebec bridge. When track laying was completed in November, 1913, there were 1,803 miles of main line, 20 miles of double track and 423 of sidings.

**Ottawa, Ont.**—An agreement between the city and the J. B. Strauss firm, of Chicago, for the preparation of plans for the Ottawa East bridge is to be drawn up, and if approved of by the engineer of the Department of Railways and Canals, sent to Chicago for execution. On the advice of the city engineer, the Board of Control has decided to accept the offer of the Strauss firm for preparing the plans and acting as consulting engineers, the fee for this to be $5,600.

**Ottawa, Ont.**—While developments are not anticipated for some time in regard to the lease by the G. T. P. of the eastern division of the N. T. R., there is little likelihood that the Government itself will be forced to operate the line. If the Grand Trunk fails to implement its contract of lease it is intimated here that another company representing wealthy Canadian interests would be formed and be prepared to take over the line on the same terms as are embodied in the G. T. P. contract.

**New Niagara Bridge.**—President Wilson has signed the Gittins bridge bill, authorizing the Ontario-Niagara Connecting Bridge Co. to build a bridge across the Niagara river north of the Niagara Falls city line. A bill authorizing the building of the bridge will be introduced in the Canadian House of Commons early in the session that is about to begin. The bridge company is authorized to build a bridge for pedestrians, vehicular, steam and electric railroad traffic, and for the carrying of telephone, telegraphic and electric wires over the river. The Mackenzie-Mann syndicate is interested in the bridge company and it is said that the proposed bridge will either afford an entrance to the United States for a new trolley road from Toronto, or for the C. N. R. The company plans the building of a line from Lockport to the Falls, connecting both cities with the new bridge.

# Wood-Working

**Dundas, Ont.**—The Brown & Liddy Co., will establish a box factory here.

**Strathroy, Ont.**—The head office of the Canadian Handle Mfg. Co. will be located here instead of in London.

**New Westminster, B.C.**—The Superior Sash & Door Co. factory was destroyed by fire on February 6. The damage is estimated at $100,000.

**Westport, Ont.**—The Wm. Dier Co., carriage factory was destroyed by fire recently. The damage is estimated at $3,000, part of which is covered by insurance.

# New Incorporations

**The Beaver Oil & Gas Co.** has been granted letters patent to operate oil, gas and mineral lands, etc., within the Counties of Essex, Kent, Elgin and Lambton, Ont.

**Ottawa, Ont.**—The Chatham Packing Co., of Chatham, Ont., has been incorporated to take over the business of the O'Keefe & Drew Abattoir Co. The capital is $400,000.

**The Canadian Shirt and Overall Co.** has been incorporated at Winnipeg to manufacture Clothing. The capital of the company is $60,000, and head office at Winnipeg, Man.

**The Lloyd Mfg. Co.** has been granted a license to carry on the business in Ontario of making metal wheels, wire-working machinery, etc. M. K. Cowan, of Toronto, has been appointed attorney.

**Canada Universal Nut Lock, Ltd.**, has been incorporated at Toronto, Ont., with a capital of $100,000, to manufacture nut locks at Toronto, Ont. Incorporators—J. M. Robinson, J. Booth and J. D. Blissett, all of Toronto, Ont.

**The Middlesex Mills, Ltd.**, has been incorporated at Toronto, Ont., with a capital of $80,000 to manufacture linens, cottons, silks, etc., at London, Ont. Incorporators: W. J. Teasdall, F. Barnett and Albert Mitchell, all of London, Ont.

**Leather-Canvas-Textile Mfg. Co.** has been incorporated at Ottawa, Ont., with a capital of $50,000, to manufacture leather and canvas goods, etc., at Ottawa, Ont. Incorporators—R. G. Code, E. F. Nurritt and J. R. Osborne, all of Ottawa, Ont.

**The Kaufman Rubber Co.** has been incorporated at Ottawa, Ont., with a capital of $2,000,000, to carry on business in rubber and rubber products at Berlin, Ont. Incorporators—J. Kaufman, M. R.

## Catalogues

**Belting.**—The Canadian Fairbanks-Morse Co. have arranged to carry a large stock of all the well-known brands of belting made by the Graton & Knight Manufacturing Co.

**Twist Drills.**—The supplement to catalogue No. 8 issued by the John Morrow Screw & Nut Co., Ingersoll, Ont., is devoted to twist drills. The various styles are illustrated and the price and other particulars of each size given.

**Goggles.**—Eye protectors of various styles are described in a bulletin issued by T. A. Willson & Co., Inc., Toronto. Each style varies to suit particular requirements, and illustrations are given of each, accompanied by a brief description.

**Dwight Slate Marking Machines,** manufactured by the Noble & Westbrook Mfg. Co., Hartford, Conn., are described in a catalogue recently issued. Both power and hand-operated machines for placing on flat or round metal surfaces impressions of trade marks, patent dates, graduated scales, etc., are featured. Full particulars are given of each type of machine, including capacity, shipping weight and price. A number of sample marks and illustrations show the wide range of application, while a list of users is also included.

METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers.

**We do any kind of sheet metal stamping that you require.** Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time.

We can finish steel stampings in Nickel, Brass or Copper.

Send us a sample order.

W. H. BANFIELD & SONS

120 Adelaide St. W., Toronto

## Manufacturers' Agents

We frequently receive inquiries from manufacturers of machinery specialties or supplies, asking us to suggest the names of reliable agents who might be interested.

For the benefit of Manufacturers' Agents who are subscribers to "Canadian Machinery," we maintain a bureau of information regarding agencies available.

We will be glad to hear from reliable agents desiring suitable lines, in order that we may put them in touch with enquiring manufacturers.

State lines you are specially interested in, and see if we can't connect you with something worth while.

Your name will be kept on file and you will be communicated with from time to time, as occasion arises.

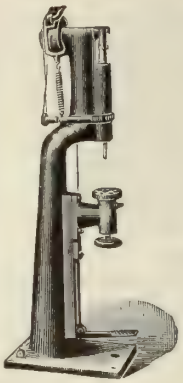
## Genuine Armstrong Stocks and Dies

**Hinged Pipe Vises.**
**Pipe Cutters. Steam and Gas Fitters' Tools.**
**Pipe Machines for Threading Pipe.**
Either Hand or Power.

*Manufactured by*

**THE ARMSTRONG M'F'G CO.**
328 KNOWLTON ST. BRIDGEPORT, CONN.
NEW YORK, 248 CANAL ST.



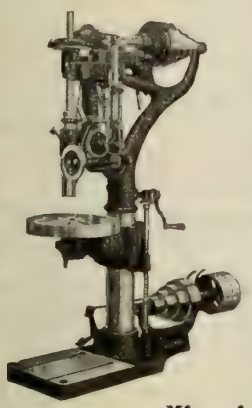
## Light and Heavy Riveting

can be done equally well on our ELASTIC ROTARY BLOW RIVETING MACHINE because the force of the blow is always under the control of the operator, and quickly adjusted to suit the work.

The machine is made in several sizes and styles, and every head is perfectly formed, any shape you wish.

Catalogue?

**The F. B. SHUSTER COMPANY**
New Haven, Conn.
Formerly John Adt & Son. Established 1866
Also makers of Wire Straighteners, for rounds, squares, hexagons, etc.
Canadian Agents: A. R. Williams Machinery Co., Toronto.



## Our 23" Mechanic's Drill

has features with which you may not be familiar.

There are eight speeds provided, with quick advance and return.

Stationary Head and Back geared with automatic stop. This drill can be motor-driven and will drive high-speed drills to their utmost capacity. The quality is the same as all "Rockford" quality—the best.

**Write for descriptive catalogue.**

**Rockford Machine Tool Co.**
Rockford Illinois

**Mfrs. of the Rockford Planer and Shaper.**

## VIKING
### WATERPROOF CEMENT LEATHER BELTS

**Will Save You Much Money, Time, Trouble and Worry**

"Viking" Belts are just in their element when in wet places and under adverse conditions.

A trial will convince you that they are all-round savers. **Write for particulars.**

**J. C. McLaren Belting Co., Limited**
MONTREAL TORONTO WINNIPEG

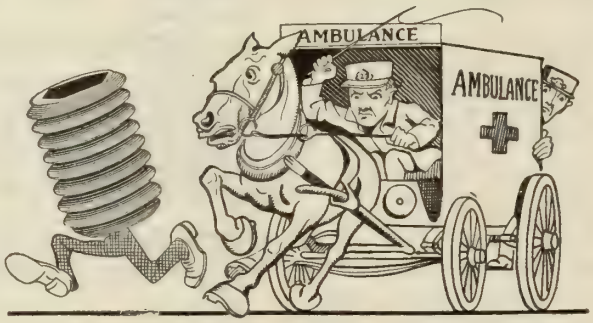
## The Garvin Machine Co.

**Manufacturers of**

Milling Machines; Profiling Machines; Cam Cutting Machines; Screw Machines; Monitor Lathes; Die Slotting Machines; Screw Slotters; Tapping Machines; Duplex Horizontal Drills; Gang Drill Presses; Four-Head Right-Angle Drills; Wrenchless Chucks; Spring Coilers; Cutter Grinding Machines; Surface Grinders; Hole Grinders; Hand Lathes and Special Machinery.

**We Want All To Have Our Catalog—Send For It To-day.**

**Spring and Varick Streets, NEW YORK CITY**



Don't wait till you have an accident, equip your machinery now with Allen Safety Set Screws, and safeguard your workmen.

All sizes from ¼ inch to 1 inch carried in stock.
Send for Circular No. 3, and sample screw.

**THE ALLEN MFG. CO.**
St. Johns, P.Q. CANADA

# CLUTCHES

**Combined Jaw and Friction. Friction only Gas Engine Clutches. Jaw Clutches.**

Write for interesting printed matter.

**The Positive Clutch & Pulley Works Ltd.**

MONTREAL Factory: Aurora, Ont. TORONTO

**20 TIMES THE SERVICE**

That's what this self-hardening, high-speed steel chaser does for the LANDIS DIE. Four long cutters tangentially disposed to the work carried in suitable holders make an ideal cutting condition. This, along with its many other distinctive characteristics, has established for us a world-wide reputation.

WRITE FOR CATALOGUE NO. 21.

## Do Your Men

# USE or ABUSE

## Their Files?

The correct USE of a file is to retain it on a certain class of work until its efficiency is impaired. When it reaches the point where it requires more effort to remove less stock, it should be promptly replaced with a new one.

The ABUSE of a file is its retention *after* it has passed the "impaired efficiency" point. It is no longer able to operate swiftly, accurately nor economically. The expensive time and labor it wastes more than offsets the cost of several new files.

Investigate filing-conditions in your plant. See if your mechanics are *using* their files to *your profit*—or *abusing* them to *your loss.*

Insist that all files be replaced *promptly* —preferably with the

***Famous Five:***

**KEARNEY & FOOT**
**GREAT WESTERN**
**AMERICAN**
**ARCADE**
**GLOBE**

**(Made in Canada)**

They have every advantage in their favor: 50 years' experience. 5 modern plants. Highly specialized factory equipment. Every manufacturing step controlled by us.

A 60,000,000 yearly output guarantees economical production. Numerous careful inspections and strenuous practical tests insure uniform efficiency in every one of the FAMOUS FIVE.

WHEN you need new equipment or supplies for your machine shop

**Consult this Directory**

¶ You'll find listed here the reliable makers of the lines you need; firms who believe in the progressiveness of present-day manufacturers and who appeal to their intelligence through their own engineering journal.

¶ Consult Canadian Machinery Buyers' Directory and you can't go wrong in your buying.

# M.A. HANNA & Co.

Sales Agents

Cleveland

Lake Superior Iron Ore, Pig Iron and Coke

Exclusive Sales Agents for

**Victoria Pig Iron**

Made at Port Colborne, Ontario

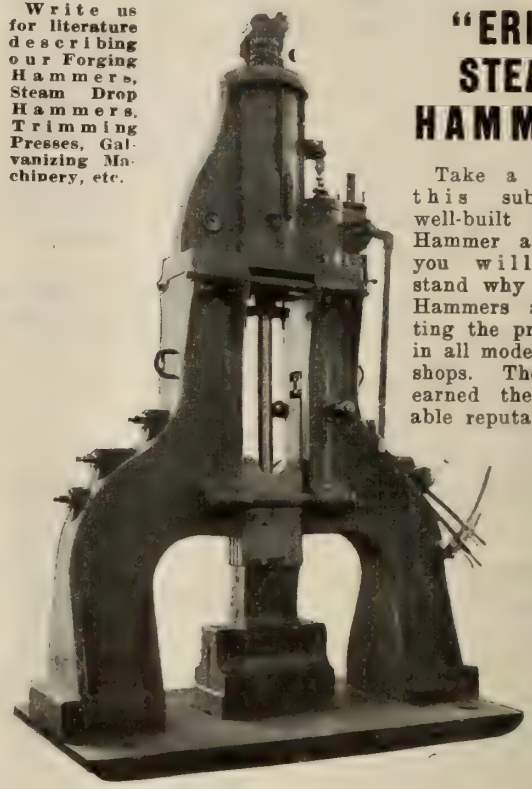
Also

Buffalo and Zug Pig Irons

Made at Buffalo and Detroit

M·A HANNA & Co.

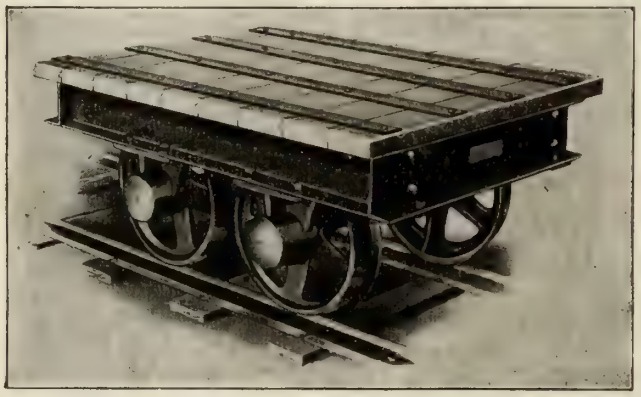
Write us for literature describing our Forging Hammers, Steam Drop Hammers, Trimming Presses, Galvanizing Machinery, etc.



**"ERIE" STEAM HAMMERS**

Take a look at this substantial, well-built Steam Hammer and then you will understand why "Erie" Hammers are getting the preference in all modern forge shops. They have earned their enviable reputation.

**Erie Foundry Company, Erie, Pa.**



# Cars and Trucks

Standard designs for foundry, shop and yard use. Riveted steel frames make them indestructible. Equipped with protected roller bearings. Designed for hard service. **Send for catalog and prices.**

**Complete Foundry Equipments**

WHITING FOUNDRY EQUIPMENT CO. HARVEY-ILL. U.S.A. CHICAGO SUBURB

**Cranes of all Kinds**

# PERFORATED METALS

XL

Write to us regarding your Tool Room partition problems. We can save you space and light.

We make any size perforation in any kind of metal required.

**Canada Wire & Iron Goods Co., Hamilton**

We also manufacture

- Wire Cloth for all purposes
- Concrete Reinforcement
- Molders' Riddles and Bellows
- Metal Clothes Lockers
- Steel Factory Stools
- Window Guards
- Ornamental Wire and Iron Work

# CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS--Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5.00 per line a year is charged to non-advertisers.

# Books for Foundrymen

Three good Books that should interest Foundrymen who wish to know more about their work.

**PATTERN MAKING. By James Ritchey,** Instructor in Wood Working, Armour Institute of Technology. 100 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price ..... $1.00

**FOUNDRY WORK. By Wm. C. Stimpson,** Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price, ..... $1.00

**PATTERN MAKING. By G. H. Willard.** To which are added chapters on Coremaking and Molding. 214 pp., 312 illustrations. Cloth binding Dealing with the practical experience of foundry work, tools required; woods adapted for the work; turning; and all kinds of patterns. Price, postpaid .. $1.10

# Tools and Instruments
## Graduated in Metric Units

Throughout Canada many manufacturers are making goods for the allies and many of these products have to be made according to the European or metric standard of measurement. This necessitates the use of metric instruments in connection with the manufacture of such goods.

We call to the attention of these manufacturers the fact that we make a complete line of tools and measuring instruments graduated according to the metric system, and we can furnish promptly any of these tools for immediate use.

Some of the tools and instruments thus graduated are steel rules and tapes, combination squares, combination sets, micrometers of all kinds, vernier calipers, caliper squares, etc.

*Purchase these tools from your hardware dealers or supply houses. Write to us for a copy of our 320-page free catalog, No. 203, describing 2100 styles and sizes of fine tools.*

## UP AGAINST IT!

This is an 18 Pr. Shell after firing proof.

It was supposed to hit a sand-bank but—it hit a rock.

As a result it looks slightly "Up against it."

Purchasers of Machine Tools are often in the same shape:—

They buy **on price** for to-day's apparent needs and when to-morrow's demands have to be met they are—

UP AGAINST IT.

## BERTRAM MACHINE TOOLS

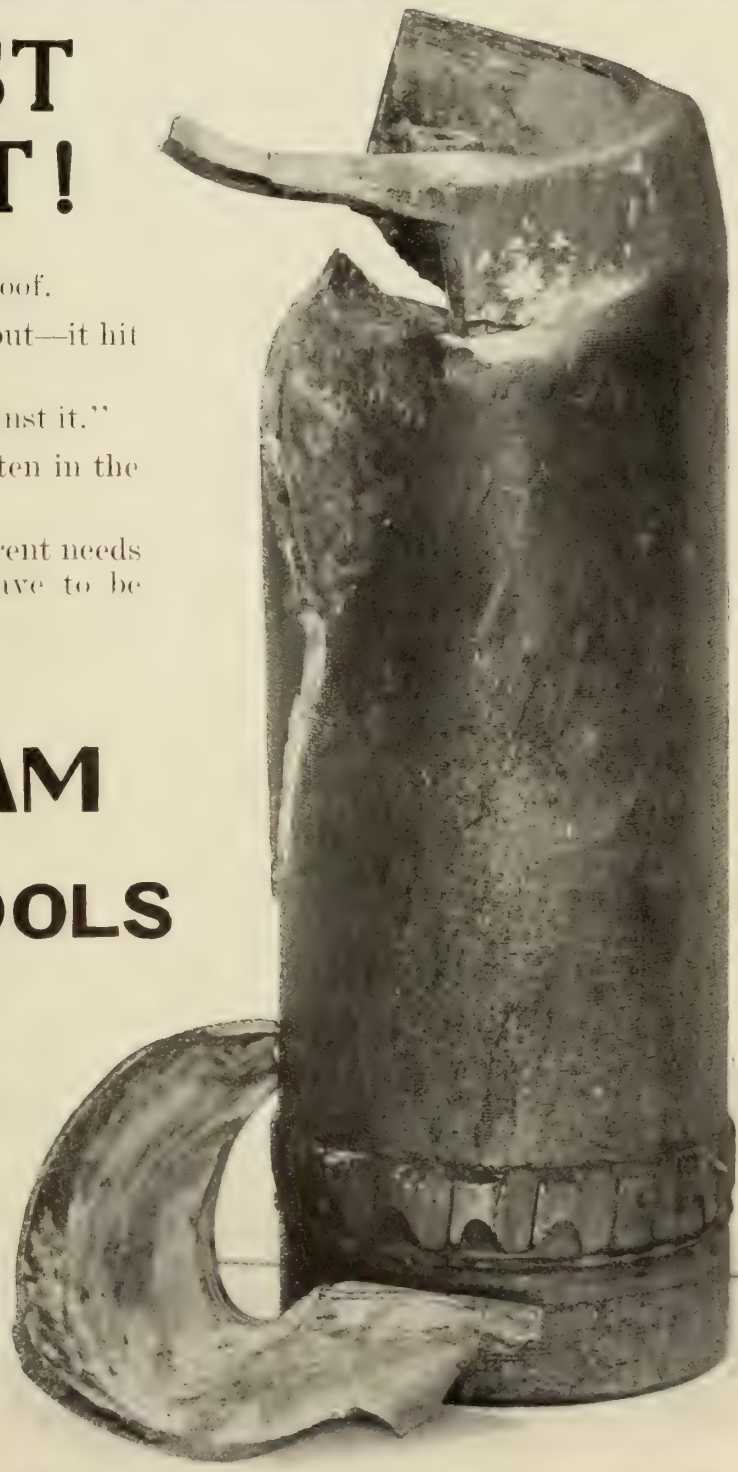
have a margin of QUALITY and STAYING POWER

over the needs of to-day to "stand up" under the increased demands of years to come.

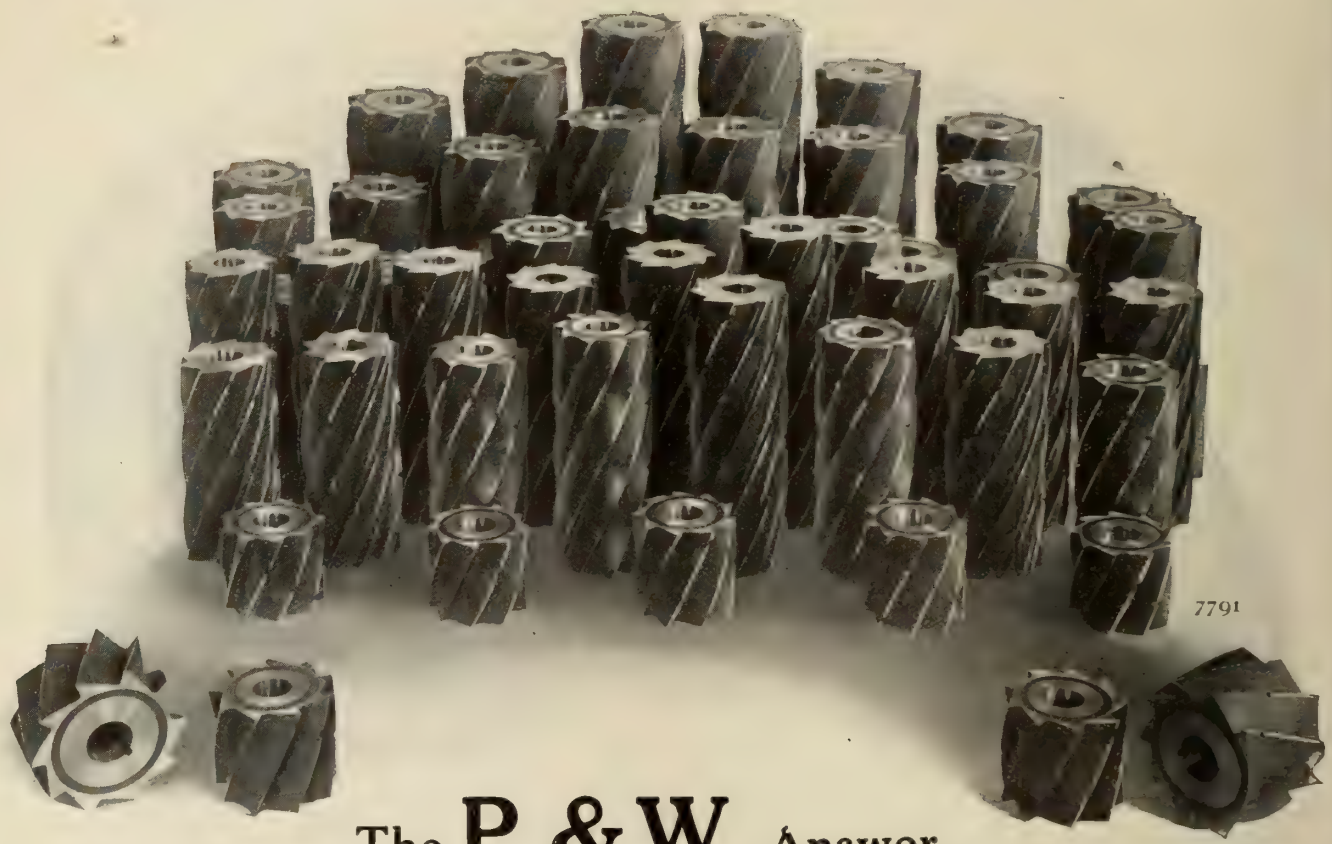
Let us show you why.

**The JOHN BERTRAM & SONS COMPANY**
LIMITED
DUNDAS, ONTARIO, CANADA

MONTREAL—723 Drummond Building
VANCOUVER—609 Bank of Ottawa Building
WINNIPEG—Bank of Hamilton Building



# Your Heavy Duty Cutter Problem



## The P.&W. Answer

### Use Coarse Tooth, High-Speed Milling Cutters

We are prepared to furnish promptly coarse tooth milling cutters of High-Speed Steel adapted primarily to the heavier class of milling.

**Long Life**

Such cutters have the advantage of long life as the large teeth permit of more grindings. It will also be seen that less time is required to sharpen.

**Increased Production**

The ample chip room insures a remarkably free cutting action and will increase production by a high percentage with less power required to drive.

**Strong Teeth**

The teeth being larger are exceptionally strong and will easily stand the heaviest feeds without breaking.

MADE IN CANADA BY

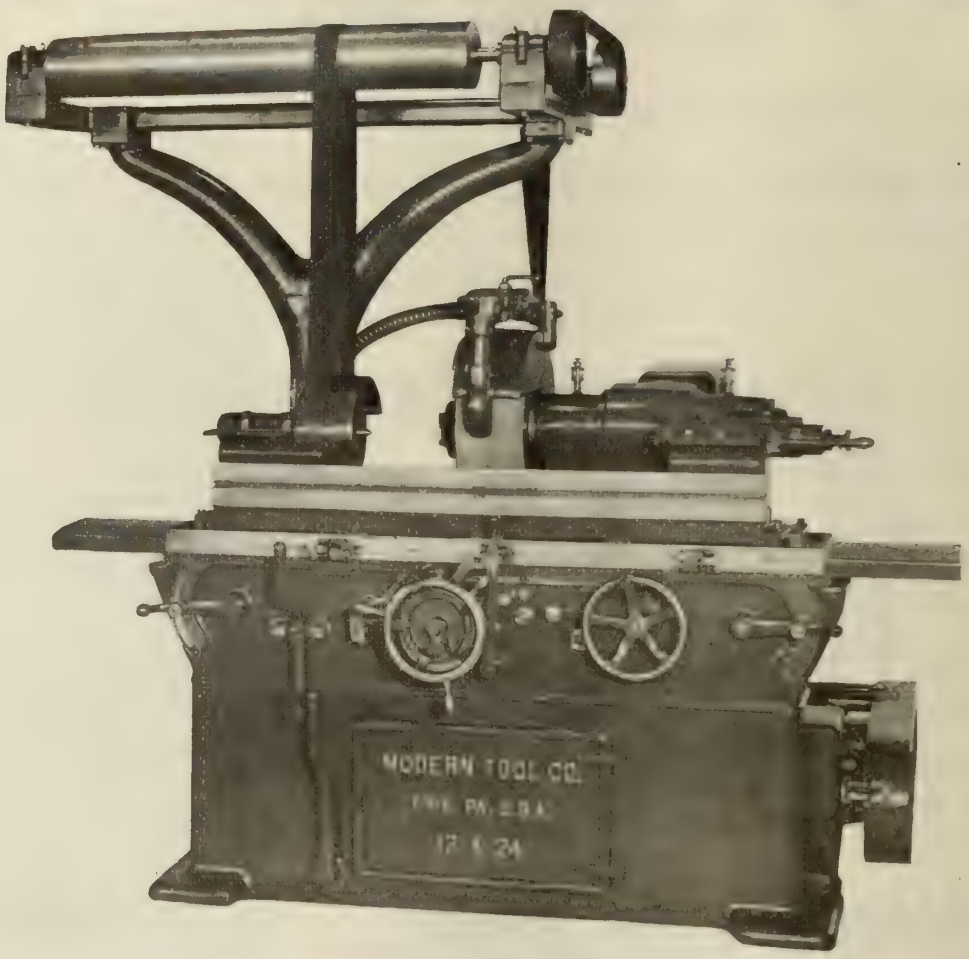
# Finishing Shrapnel Shells

ON THE

## "MODERN" 12" x 24" Self-Contained Grinding Machine



## The heaviest, most powerful and efficient Standard Grinding Machine made for Shell work

The "MODERN" 12" x 24" Grinding Machine is especially adapted for grinding Shrapnel Shells. The Machine is more than guaranteed, it is demonstrated. Large diameter, wide face wheel, with powerful drive—automatic feed without traversing the table—absolute central control of all levers and hand wheels—single constant speed drive.

We have recently sold a large number of these Machines in Canada, completely equipped for Shrapnel Work. Ask the man who is using the "MODERN."

The large manufacturer appreciates the production possible on this Machine. Machine comes equipped for all classes of straight and taper cylindrical work.

**Send for blue prints and estimates.**

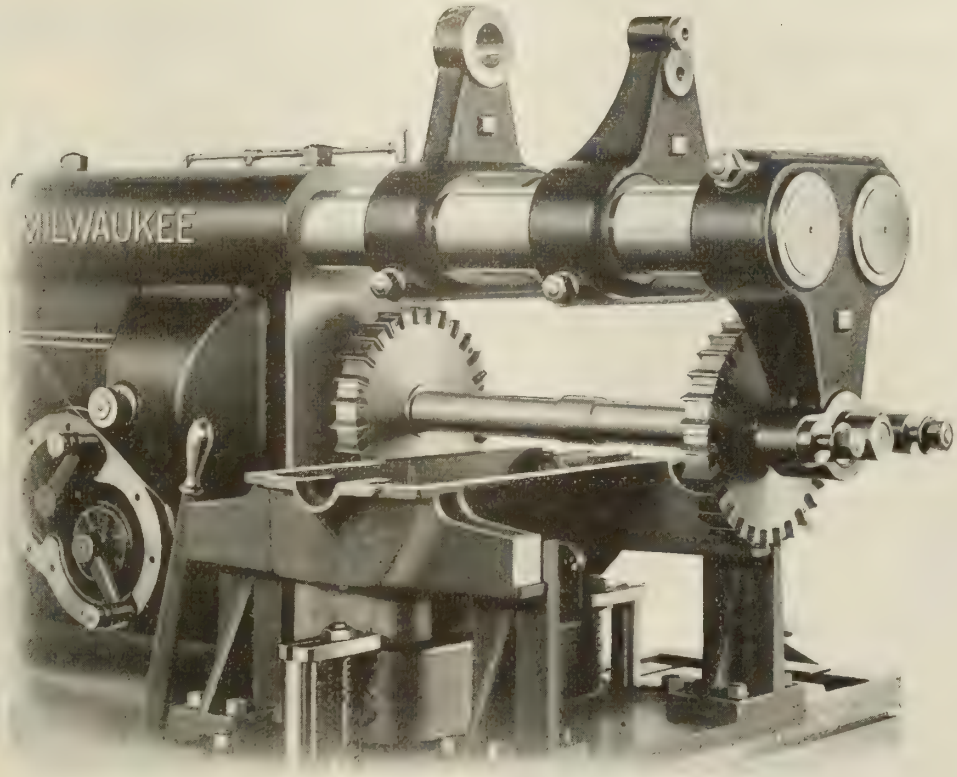
**Canadian Agents: Rudel-Belnap Machinery Co., Toronto and Montreal**



# A Job That Benefited By The Double Over-Arm

The arms of an automobile engine are shown being milled on a No. 3B Plain Milwaukee Miller. The distance between cutters is 20″.

The arm braces have been left off as they would interfere with loading and unloading the work. To do work of this character well without arm braces would be practically impossible, however, were it not for our double over-arm.

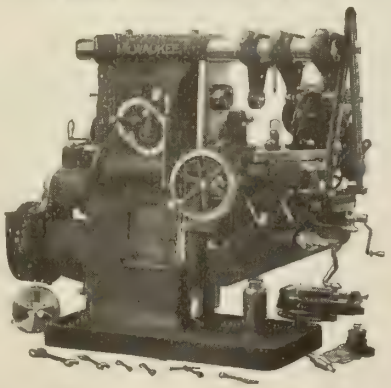
The double over-arm is two steel bars arranged accurately parallel with the spindle and at sufficient distance to form a rigid truss for the cutter arbor when the arbor bearings are clamped to them.

In this case the arbor supports are not used to support the arbor. They are accordingly turned bottomside up and clamped to the over-arm. They thus lace the bars together and so maintain the necessary rigidity at the outer end of the arbor. In this way the outer cutter is held right, despite its distance from the spindle.

Another important factor in handling this job is the flanged spindle construction. Instead of threading the spindle we use a flange of large diameter which is integral with the spindle. This flange carries keys. A collar with recessed notches to receive the dogs on the arbor is held to the face of the flange by four screws.

With this construction there is a minimum of spindle overhang, and the nearest cutter can, therefore, be held unusually close to the column. The table can, in turn, be adjusted closer to the column. The result is a very rigid set-up in every particular.

The many unique and excellent features of Milwaukee Millers give them an extreme flexibility and rigidity. This flexibility and rigidity often make unnecessary the purchase of much heavier tools for producing the same work



One of the most satisfying points about our machines is their stamina — their ability to perform heavy duty continuously over long periods of time—their freedom from breakdown troubles. And two of the important factors in securing this desirable end are the cascade system of lubrication and the use of hardened steel gearing and shafting.

Briefly, a gallon of oil per minute flows over all gears and through all grooves, flushing away dirt and grit, lubricating thoroughly every moving part inside the machine. Hardened steel gearing and shafting so lubricated constitute a speed arrangement that it is practically impossible to wear out.

Milwaukee Millers are thorough machines. They have other features as unique and as excellent as those mentioned. But in addition, every detail has been so carefully considered and so well taken care of that the results cannot be otherwise than the best.

**Our new Catalogue No. 19 gives the pertinent and interesting facts that every milling machine user should know. Write for your copy.**

# Both  Sides

of these cast steel electric starter frames are milled on a Cincinnati Semi-Automatic Duplex in 3.5 minutes, within .002″ of parallelism. The 7½″ diameter cutters run 41 r.p.m. with feed 4″.

At the end of the cut the table automatically returns 100″ per minute to starting point and stops ready for operator to unload, thus saving his time and strength.

For pieces having intermittent cuts, Cincinnati Semi-Automatics are even more productive, as instead of idly cutting air, they jump the gaps 100″ per minute. Their patented **time-saving features of intermittent feed, rapid traverse and power quick return** are fully described in our special circular.

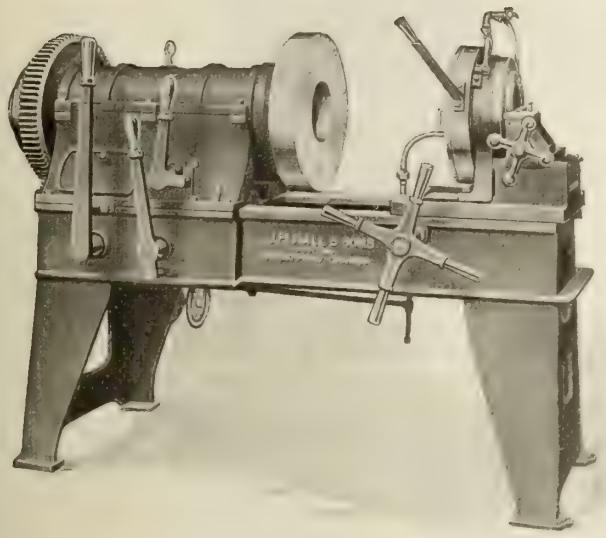
# THE HALL NO. 6 PIPE MACHINE



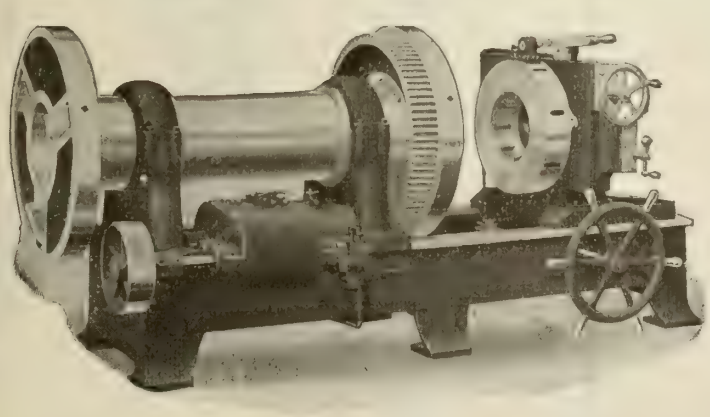
When you buy Hall Machinery you keep Canadians employed. We are a Canadian firm, employing none but Canadian labor. Our guarantees are not at "Long Distance." We are at your door.

Our Machinery is the best that mechanical ability can produce and does not cost as much as imported machinery.

Write us for catalog and prices on pipe-threading lathes, any capacity, from 1/8 to 18-in., also single and double head rapid nipple machines. No delays, delivery from stock.

## JOHN H. HALL & SONS, LIMITED
BRANTFORD, CANADA

# FOLLOW THE LEADERS



Your first view of a Bignall & Keeler pipe machine will impress you with the absence of all frills and after-thoughts. The general design is pleasing, and one to inspire confidence as to its ability to turn out good work.

When you buy a Bignall & Keeler machine you are buying the choice of those who have made it their business to know pipe machines; they who are wise to the type which means long life and unfaltering service. If the big users of pipe machines in the country pick B & K machines, you run no risk in following their lead.

Eighty-five concerns in one city bought two hundred and thirty machines, and sixty-five of the eighty-five placed repeat orders—one placed five repeat orders.

*The advertiser would like to know where you saw his advertisement—tell him.*

**You note a tendency on the part of many mechanics to get the last bit of wear from a file.**

**In saving the file—they overlook the time-waste of using an inefficient file.**

## "Saving at the Spigot and Wasting at the Bung"

Because—at a certain point in the life of any file it begins to lose its efficiency. Beyond that point more time is required to do less work. Either the quantity or quality of work—or even both—must suffer. The net loss of time and output far exceed the extra cost of several new files.

This continued use of an inefficient file constitutes a tiny saving in file-cost with a big waste of labor and time. It should be stopped by promptly replacing all worn files, when they reach the "inefficient" point. This point can easily be determined—on your own work—in your own shops. It is very late in the "Famous Five"

**KEARNEY & FOOT**
**GREAT WESTERN**
**AMERICAN**
**ARCADE**
**GLOBE**
***Made in Canada***

Because they are made under exceptionally favorable conditions. 50 years' experience with over 4,000 different types of file—with five great modern plants—with an annual output of 60,000,000 files gives us many advantages in the way of uniform efficiency and economy. The design and development of much specialized file-making machinery and our absolute control of every operation from furnace to file—are vital factors in our holding 90% of Canada's file trade.

**A trial of the "Famous Five" in your shops is the best proof of their efficiency we can suggest.**

## Make One Barrel Do What Two Barrels Did Before

THE minute you install one Globe Tumbling Barrel you can pension two of your old-fashioned horizontal barrels and still do a wider variety of work—and do it a great deal better and many times faster.

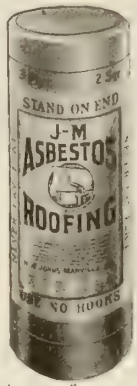
**GLOBE TUMBLING BARRELS**

save time because they don't have to be stopped for filling, emptying or inspecting of the work. They save floor space, because they stand vertically and occupy little room—and they save money, because they require a smaller investment in barrels.

**Eight stock sizes, $50 to $170. Our Booklet 2 contains useful information on tumbling — shows the different styles of Globe Barrels and tells what each will do. Write for a free copy to-day.**

**The Globe Machine & Stamping Co.**
**Cleveland, Ohio, U. S. A.**

## Buy Roofing as You Buy Your Life Insurance



A HUNDRED and one roofing manufacturers ask for your patronage. Each backs his claims with arguments that seem convincing. It's confusing, to say the least. And the loss is yours, if you select unwisely.

There is only one absolutely safe course to follow. Buy roofing as you buy your life insurance!

Just as you consider the insurance company first and the policy second—because you realize that the policy is simply a promise to perform and the standing of the company your actual security—so you should consider the roofing manufacturer first and the roofing itself second.

## J-M ASBESTOS ROOFING

We tell you that this roofing is made from asbestos rock—that it is practically imperishable—that it is unaffected by heat or cold, rain or sleet—that it affords excellent fire protection—in short, that it will give you absolutely satisfactory and lasting service without any painting, coating or attention whatever.

But, more than this—we remind you that behind this "promise to perform" is the security that lies in buying your roofing from a company with a country-wide organization built up by a policy that does not willingly permit a single customer to be dissatisfied.

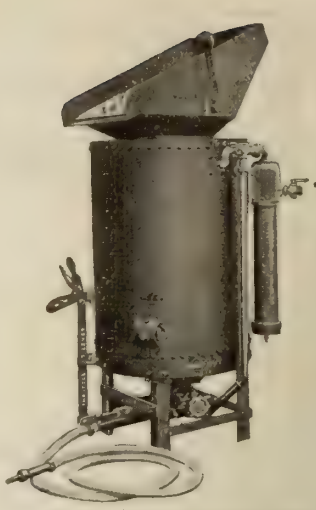
**Shelton Metallic Filler Co.**
**DERBY, CONN.**

# Vital Factors in Profitable Casting Cleaning

A Good Sand Blast and Cheap Air

# Curtis Sand Blasts



Closed Hopper Sand Blast

Have many features that make them superior.

For instance—Sand screened and Hopper filled at one operation.

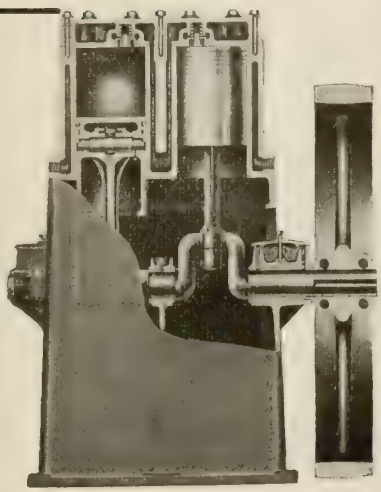
LEVER-OPERATED FILLING VALVE is much faster and handier than the usual screwed-in plug or bolted-on cover valves.

HANDY THROTTLE CONTROL that saves time, air and sand.

WATER SEPARATOR that means fewer chokes due to damp sand.

CHOKE RELIEF VALVE that almost instantaneously relieves a choke when one does occur.

GREATER CUTTING ACTION, due to design that insures less drop in pressure between air line and nozzle.—But why not send for a Curtis Blast on thirty days' free trial?



**CHEAP AIR.**

Service tests prove that CURTIS COMPRESSORS will furnish air at minimum cost for operation and maintenance. They have FEWER PARTS than most compressors and less friction loss. Cylinder heads and valves, as well as cylinder walls, are water jacketed (about 80% more cooling area than double-acting compressors), insuring minimum discharge temperature and less loss of power in pipe line. THE VALVES are lightest of all types—tempered steel discs (1-16 inch in thickness)—they require less attention than any other type.

***Write us for Bulletin C-1 and Prices.***

100 h.p. Morse Chain Drives for Wire Drawing Benches in the plant of Dominion Iron & Steel Co., Sydney, N.S.

Note the compactness of these 100 h.p. units.

# Morse Silent Chains

represent the logical drive for mill and factory service where these points are considered: (1) Efficiency, (2) Durability, (3) Economy.

(1) In efficiency they stand supreme, a sustained 98 to 99%; unapproached by any other system for transmitting power.

(2) In durability they compare favorably with any system, instances, not uncommon, of 10 to 12 years' service without repairs being recorded.

(3) In economy, they again stand alone, as their saving of power compared to other systems, is sufficient to pay back their entire first cost in from one to three years.

We will gladly furnish detail information to any engineer who is figuring on saving power and will co-operate with him in working out his transmission problems.

# "Shell" Lathes

The abnormal demand for equipment for the manufacture of shells has practically depleted the stocks of every machinery builder. Fortunately we were well supplied and still have in stock, for immediate shipment, several

## 16", 18" and 20" Engine Lathes

suitable for shell work. Our machine tool experts are thoroughly familiar with all the details of this work, and will be very glad to give you every assistance in selecting machinery for your work.

We also have in stock many other machine tools for general work, and are prepared to quote prices and give full specifications on machinery for Railway Shops, Wood-Working Plants, Garages, etc., in fact for the smallest or the largest requirements.

# APPRENTICESHIP SYSTEM—The G.T.R. Motive Power Department.

By R. M. Fair

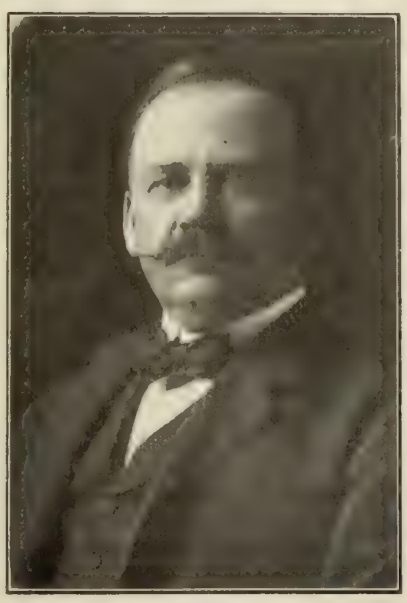
"THE INTERNATIONAL LIMITED"—GRAND TRUNK RAILWAY SYSTEM, MONTREAL AND CHICAGO.

*The object of an apprenticeship system is to provide a supply of well-trained mechanics, foremen, and staff officers who can be relied upon to go ahead with and carry out efficiently and successfully productive work in a particular sphere of manufacturing and industrial enterprise. It has been found from experience that men so trained become not only a valuable asset to those directly concerned, but are an important contributory factor in the matter of that higher standard general competence, so necessary to manufacturing achievement.*

THE Grand Trunk Railway have employed apprentices in their shops and roundhouses for a good many years, but until about fourteen years ago very little attention was given them. The remuneration then was only about four cents per hour and consequently the apprentice had to depend almost entirely upon his parents for support. There were then no evening classes in drawing and mathematics, and apprentices wishing instruction in these lines used to hire their own instructor who oftentimes was none too competent. The only requirement as an apprentice was that the applicant be fifteen years of age, no attention being paid to his mental or physical condition or other qualifications.

About the year 1901, considerable developments were taking place in railroad shop practice, requiring as a result a more intelligent class of mechanics and foremen, and the G. T. R. decided from then on to give more time and attention to the training of their apprentices. Already a school had been opened at one of the large shops and evening classes started. The instruction was not only free, but it was compulsory for every apprentice to attend. Similar schools were organized at the other large shops. These schools had no connection with the Government or other educational institution, but were controlled and operated entirely by the company.

Trouble, however, soon arose with the apprentice material to be dealt with. A majority of the boys had been careless with their day-school education, merely idling away their time until the law permitted them to learn a trade. As a remedy, every future applicant was required to pass an examination, and to do so called for the fair degree display of a common school education. For a while, a large number of the applicants had to be rejected but there was obtained the desired effect, namely, that boys to enter the shop must go to school longer and pay more attention to their studies. As an ultimate result, the educational standing of the apprentices was increased fully fifty per cent.



E. J. CHAMBERLIN,
President, G.T.R., System.

Such excellent results were being obtained from the educating of their own workmen that W. D. Robb, superintendent of Motive Power, decided to put this apprenticeship system in force throughout the whole of his department, and to, if possible, still further increase its efficiency. He supervised the publication of textbooks which have been the foundation for the editing of better ones. He also introduced the system of annual examinations, giving prizes to the best students. Thus, by using the same textbooks and having the same annual examinations, the subject matter taught throughout the system was made standard, and the co-operation of the instructors in discovering the best methods of handling the apprentices was obtained.

Trouble was experienced, however, by apprentices being attracted away during their third and fourth year by manufacturers, but Mr. Robb got over this difficulty to a large extent by having every apprentice indentured. The effect of this and other changes to keep boys in service is brought out clearly in dia-

The author of this article is a student in Mechanical Engineering (Class 1915), McGill University, Montreal.

gram No. 1, the class of 1910 being the first to graduate under this new regulation. To Mr. Robb, his chief draughtsman, Mr. Powell, and his staff of capable master mechanics, the Dominion of Canada is more or less indebted for the helping hand the G. T. R. is giving to the solution of the important problem of industrial education. E. Meldrum, supervisor of apprentices, is also taking a large share in the building of the system. Since his appointment to office in 1913, he has surrounded himself with groups of capable teachers, and has revised the textbooks, thus raising the efficiency of the instruction to a much higher degree.

To give the reader a more vivid idea of the relative growth of the system at the Stratford shops, Diagram No. 2 was drawn. From this it will be noted that the number of apprentices increased almost twice as fast as the number of employees, and the growth over the whole system has been almost identical with that at Stratford.

### Selecting and Enrolling Apprentices.

The problem of attracting and selecting apprentices is one of the utmost importance, for, without good apprentice material, inferior mechanics are the result. The company may build schools, provide teachers and shop instructors, but, unless the boys are physically, mentally and morally fit, the effort to make skilled mechanics will be in vain.

The G. T. R. realizes the importance of this and, in order to get a supply of applicants from which to choose their class, they advertise their system far and wide. Various means of advertising are used. Articles appear in the technical and other press from time to time, special pamphlets are distributed with the company's general advertising matter, drawings made by the apprentices are shown at the Canadian National Exhibition and other places each year, incidentally carrying off the bulk of the prizes while, in addition, the life of the mechanic socially and in the shops is made as attractive as possible. This last feature appeals perhaps more strongly and to many more boys than any other, and the G. T. R. are to be congratulated upon the successful manner in which they are handling this problem. The following circular, issued each year from the office of the President, and applicable to lines east of the Detroit and St. Clair rivers, serves to attract high school graduates into the company's service, and the numbers tend to increase every year.

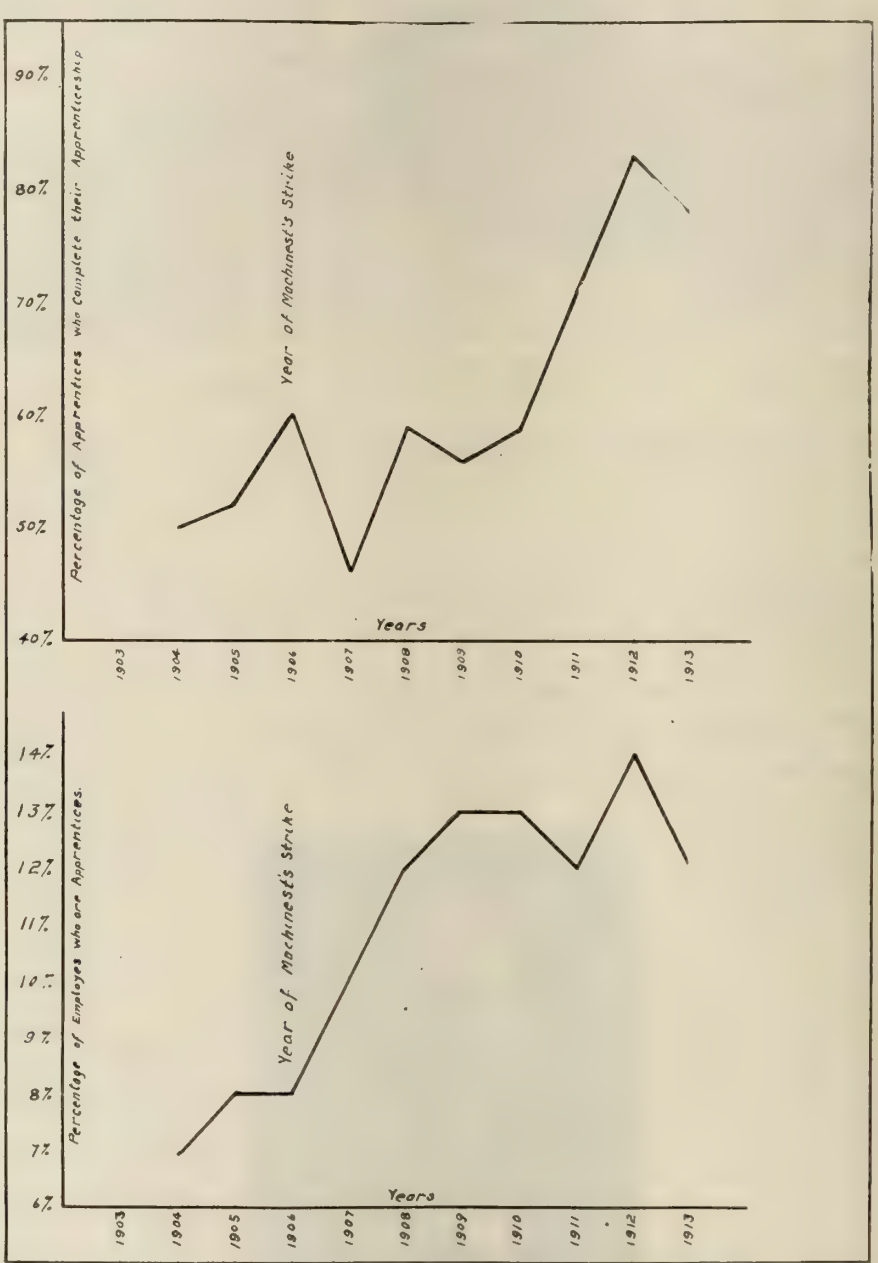


DIAGRAM NO. 1 (UPPER), SHOWING PERCENTAGE OF APPRENTICES AT STRATFORD SHOPS WHO COMPLETE THEIR APPRENTICESHIP.

DIAGRAM NO. 2 (LOWER), SHOWING RELATIVE GROWTH OF APPRENTICESHIP SYSTEM AT STRATFORD SHOPS.

**Free Scholarships Circular.**

Two free scholarships, each covering four years' tuition in the Faculty of Applied Science of McGill University are hereby offered, subject to competitive examinations, to apprentices and other employees of the Grand Trunk Railway Co., under twenty-one years of age, and to minor sons of employees.

The competitive examinations, which will be the regular entrance matriculation examinations provided for in the annual calendar of the University, will be held at the University, Montreal, and at other centres, beginning June 12th, 1914. The two candidates making the highest average and complying with the requirements of admission will be awarded the scholarships, and have the option of taking a course in any department of the Faculty of Applied Science. Scholarships will be renewed from year to year, to cover a period not exceeding four years, if at the close of each session the holders thereof are entitled, under the rules, to full standing in the next higher year.

In case a scholarship holder finds it necessary to interrupt his course for a year or more, notice must be promptly given at the close of the session to the railway company and to the head of the Transportation Department of the University, in order that the scholarship may be open to other applicants. In order to establish prior claim to the next available scholarship, notice of the student's intended return must be given to the Railway Company and to the head of the Transportation Department of the University, not later than January 1st, preceding the opening of the session in

which such scholarship will be available. In consideration of the free scholarships, students will be required to enter the service of the company as student apprentices, and serve during vacation periods while in attendance at the University, and at the option of the company, for two years after completing the college course. Successful candidates will, before entering the University, be required to execute the Company's regular form of student apprentice contract, copies of which can be obtained upon application to D. E. Galloway, assistant to president, Montreal, to whom also applications for certificates entitling eligible persons to enter the competitions should be addressed.

Copies of the annual calendar containing the conditions of admission and announcement of courses may be obtained upon application to J. A. Nicholson, Registrar, McGill University, Montreal.

(Signed) E. J. CHAMBERLAIN,
President.

### Apprentice Admission Requirements.

The requirements of admission as an apprentice are not severe but are strictly adhered to. In the case of a desirable applicant failing in part—say the examination in arithmetic, he is allowed to enter the service as a machinist assistant, and is encouraged to make another attempt. The applicant:

(a)—Must be between the ages of 15 and 19.

(b)—Must pass an examination in arithmetic. (Sample paper follows.)

(c)—Must write a letter of application, which serves as an examination in writing and spelling.

(d)—Must satisfy the master mechanic or other official as being suitable to enter the service.

(e)—Must, if his application be accepted, sign together with his parent or guardian, an agreement with the company.

(g)—Must pass a prysical examination conducted by one of the company's doctors.

### Arithmetic Examination.

The following is a copy of the arithmetic examination, the time allowed being two hours and the pass marks one hundred per cent.:

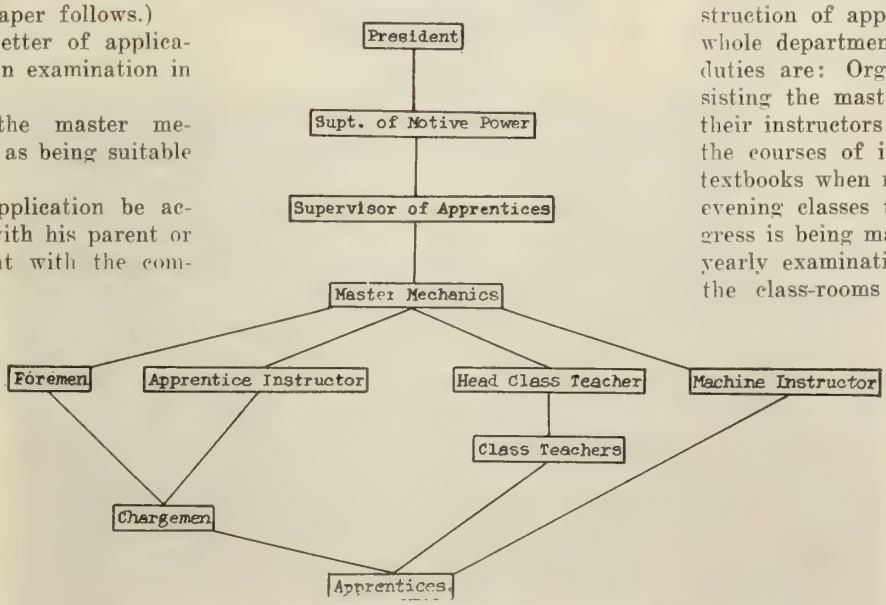
1.—Add 327, 432, 7,893, 45, 32,789.
2.—Multiply 32,695,821 by 49,071.
3.—Divide 845,321,987 by 4,235.
4.—Add 5-32, 3⅝, 7-16, ⅜, 4¾.
5.—Multiply 4⅝ by 7 3-16.
6.—Express in lowest fraction .4375.
7.—Express in lowest decimal 7-32.
8.—Multiply 12.728 by .056.
9.—Add 6.42, .321, 82.785,321.8.
10.—Divide 1,472.4284 by 326.48.

### Following Acceptance.

When a boy's application is accepted he must interview the master mechanic,

W. D. ROBB,
Supt. Motive Power, G.T.R. System.

who offers him some good advice, warning him against the forming of bad habits, pointing out the necessity of paying strict attention to all the instruction given, and the advantages to be gained by supplementing this with reading and study at home. Entering the shops as an apprentice marks with the average boy a change point in his life. He is perhaps leaving home to board with a stranger, he is passing from a schoolboy to a wage-earner, and is taking a decided step as to his future occupation. Consequently a few words of encouragement from his superior, the master mechanic, a man who has made a life study of the work into which he is now entering, leaves a marked impression upon the young apprentice mind.



SUPERVISION OF APPRENTICES -ORGANIZATION DIAGRAM.
Where there are only a few apprentices, one man may be apprentice instructor, head class teacher and machine instructor.

### Supervision of Apprentices.

The supervision of apprentices is an important problem. Conditions have changed since repair shops were small and when the superintendent was able to take a personal interest in each boy's welfare. To-day the supervising and instructing must be left to a large extent to a special staff of men. The following figure may make clear the organization of the G. T. R. for the handling of apprentices in its motive power department:

The president, being head of the company, is naturally head of the apprentice systems of the various departments such as the motive power department, car department, and transportation department. He especially controls the granting of scholarships to McGill University.

The supt. of motive power is head of the system in his department. He signs all indenture papers on behalf of the company; he authorizes all changes regarding textbooks, examinations, etc., also the method of instructing and promoting of apprentices, and in fact all important changes in the system.

The supervisor of apprentices has charge of the technical and practical instruction of apprentices throughout the whole department. Some of his special duties are: Organizing all schools, assisting the master mechanics to choose their instructors and teachers, outlining the courses of instruction, revising the textbooks when necessary, inspecting all evening classes to see that proper progress is being made, and conducting the yearly examinations. He must see that the class-rooms are being kept in a clean and sanitary condition, and that proper care is taken of the desks, drawing-boards, etc., furnished by the company. The supervisor of apprentices reports direct to the superintendent of motive power.

The master mechanic is head of the apprentices at his own station. He is entrusted with the employing of his own apprentices and instructors. He has to see that the classes are properly conducted and that the pupils are receiving sufficient attention both in the classes and in the shop.

The apprentice instructor is a mechanic employed at each shop who looks after the business end of handling the apprentices and who partially assists in the practical work in the shop. His special duties are the keeping of all records of the apprentices, the promoting of apprentices from one class of work to another, and the conducting of the examination on shop tools and practices (referred to later). With him lies the greatest responsibility, that of keeping the boys contented. To be respected by them he must have a strong personality and must be a man of clean habits, both mentally and physically.

The apprentice machine instructor is an expert machinist employed at all large shops where there are a number of apprentices employed. His whole time is spent instructing in the shop. Besides being a good practical mechanic, possessing the ability to teach what he knows, he must have a good technical knowledge so as to be able to drive home to the apprentices the practical application of problems dealt with in the classrooms.

The foremen and chargemen are the men directly over the apprentices, and must be obeyed as in the case of other employees. To the chargemen is given the bulk of the shop instruction, and in this respect very little trouble is experienced in getting their co-operation. The foremen and chargemen are held directly responsible for the apprentices' work and progress in the shop, and for this reason more chargemen are employed than if skilled labor were made use of. The chargeman reports to the apprentice instructor on the ability of the apprentices under his care to handle the work in his department.

The head class teachers are to the evening classes what a principal is to a public school. He must see that all his teachers are capable, that the work mapped out for each class is being covered, and that the apprenitces are making the proper progress. The class teachers are draftsmen and practical men from the shop who have a thorough grasp of the subjects taught, and who are capable of teaching these to a class of boys.

The apprentices are divided into two classes, namely, "regular" and "special." The regular apprentices are those who are indentured to learn a trade and who receive their school instruction from the company. They are divided in groups according to the trade they are learning. The following are the trades offered and the corresponding terms of apprenticeship:

ROBERT PATTERSON
Master Mechanic, G.T.R. Shops, Stratford, Ont.

Machinist and fitter, 5 years.
Boilermaker, 4 years.
Blacksmith, 4 years.
Tinsmith and pipefitter, 4 years.
Patternmaker, 4 years.
Moulder, 4 years.
Electrical, 4 years.

APPRENTICES AT STRATFORD SHOPS, JULY, 1914—SOME OF THE NUMBER ARE HIGH SCHOOL GRADUATES.

Special apprentices are those who are attending some recognized engineering college and who have signed the student apprentice agreement with the company. Apprentices and sons of employees who have obtained a G.T.R. scholarship to McGill University are classed as special apprentices.

Ninety-two per cent. of all apprentices are machinist and fitter apprentices and consequently in this essay where space is limited, whenever the system varies for different groups of apprentices, only the case of the machinist apprentice will be dealt with. The requirements for admission and the school instruction is the same for nearly all apprentices, but the shop instruction is naturally different.

### Shop Instruction.

For a machinist and fitter apprentice, the shop instruction is spread over a period of five years. From six to eight months of this time is spent in one of the "outer" shops, such as the smith-shop, pipe-shop, or boiler-shop; about thirty months is spent in the machine-shop; and the remainder of the time in the erecting shop.

As far as possible a regular system is followed in moving apprentices from one class of work to another, but in some cases the instructor must be guided by his own judgment and by the ability of the apprentice. The following shop schedule will give the reader a fair idea of the opportunities afforded the average machinist apprentice to learn his trade.

### General Work.

Steam hammer in smith shop, helper to pipefitter, or rivet boy in boiler shop, 8 months.

### Machine Shop Work.

Nut-facer, screwing machine, or centering machine, 6 months.

Drills, 4 months.

Slotter, miller, or boring mills, 4 months.

Shaper or planer, 4 months.

Lathe, 6 months.

Bench work on rods, motion, air brake, etc., 7 months.

### Drafting.

Drawing office, 2 months.

### Erecting Shop Work.

Re build gang, 4 months.

Eccentric gang, 3 months.

Shoe and wedge gang, 3 months.

Steam pipe gang, 3 months.

Guide-bar and valve gang, 3 months.

Pit gang (frames, motion, spring gear, etc.), 6 months.

Total, 5 years.

The work in the "outer" shops, although, strictly speaking, not pertaining to the machinist's trade, yet is of great value to the company, and is beneficial to the boys, by reason of the better, all-round training they acquire. In the smith shop the apprentice has an excellent opportunity to look around and get a good general idea of the various forging operations which will often be useful in after life. By working in the pipe-shop the boy becomes thoroughly acquainted with the locomotive, as his work lies not only in the shop but also on the test track. The boy in the boiler shop gets an excellent insight into the construction of a boiler and how it is repaired. In fact, it is a common regret among graduate apprentices, more especially those who are working in round-houses, that they had not paid a little more attention to what was going on around them during their stay in these shops.

In the machine shop the boy is first put on a small, simple machine and then on more difficult ones. No machine is considered too good or any bench work too accurate for a bright apprentice. For example, in the tool-making department usually thirty to forty per cent. of the employes are apprentices. In this connection, the following data, taken from the records at one of the large shops will be interesting:—

50 per cent. of the lathes are run by apprentices.

50 per cent. of the shapers are run by apprentices.

30 per cent. of the planers are run by apprentices.

75 per cent. of the drills are run by apprentices.

In the erecting shop, the work of building the locomotives is divided among various gangs of men, and nearly every apprentice is given several months' work in each of these gangs. One gang in particular, called the "rebuild gang," is composed almost entirely of apprentices, and is an excellent place for an apprentice to develop self-confidence in going ahead with new work. As a rule, a boy must work with a skilled mechanic until he can show his ability to work alone or with another apprentice.

In all these shops or departments, the instructing is done first by the chargeman or gang foreman, and later by the apprentice instructor. The spirit of independence is encouraged among the students thus giving a much better training than if the demonstrator was always at his right hand to help him with the least difficulty and to do the thinking for him. The efficient piece-work system in vogue in the shops greatly encourages the boys to do their work quickly, thus giving them a training essential to the making of good machinists.

### Text-book Instruction Feature.

The instruction in the shop is supplemented by a text-book, which is presented to each boy as soon as he enters the service. The book is made up of a series of questions and answers and is thus practically self-instructing. It is divided into five parts, one for each of the five years. The first part consists of seventeen questions and answers on drilling machines, their care and tools used. The second part deals partly with shaper and planer practice, and partly with lathe practice. Part three treats on screw-cutting with lathes, forced fits, and cutting speeds for lathe work. Part four deals partly with bench tools such as chisels, files, etc., and partly with erecting work such as fitting a cylinder head, putting up guide bars, etc. Part five explains main and side rod practice, laying off eccentric keyways, squaring an engine, and running over the valves. Great pains have been taken in selecting the material for this book and in presenting the topics in a simple style.

JAMES POWELL,
Chief Draftsman G.T.R. Headquarters Shops Point St. Charles, Montreal.

At the end of each year the apprentice must pass an examination on part of this book, and also must make a drawing of a model. Failure at the first attempt in either of these examinations means two months' work without the increase in pay, promised at end of each year, and failure the second time means expulsion from the service. For other groups of apprentices, the shop instruction and text books are similar.

### School Instruction.

The school instruction is the same for all regular apprentices and is given gratis by the company. The class rooms and equipment, text books and drawing supplies are furnished by the company, with the exception of drawing instruments, which are sold to the apprentices at wholesale prices.

The classes are held in the evening and attendance is compulsory for every regular apprentice. If this attendance rule were not in force, only the more ambitious boys would take advantage of the opportunity, and to make the system a success the company must formulate its rules to cope with the average boy. There are two classes a week for six months in the year, which is equivalent to one hundred hours a year. One-half the time is devoted to mechanical drawing and the other to practical mechanics.

The course in mechanical drawing in the past consisted chiefly of copying drawings from blue prints. The elementary geometrical constructions used in drafting were first dealt with and then the student was given a simple drawing to copy, which was followed by harder and harder drawings, until in the fifth year a quite complicated drawing was attempted. The teachers spend their time going from one apprentice to the other showing them how to use their instruments and pointing out the principles of mechanical drawing, lectures being given from time to time upon drafting room methods and standards. At the end of each class session an examination was held, which was a test of the student's skill to copy a drawing in a limited time.

This method of teaching did not prove altogether successful. The boys became skilled in using their instruments but were not made familiar enough with the underlying principles of mechanical drawing. The average graduate was not as proficient as a mechanic should be in reading a blue print quickly and accurately, and in making a sketch of a piece of machinery. So, in October, 1914, when the classes started again, another method was adopted.

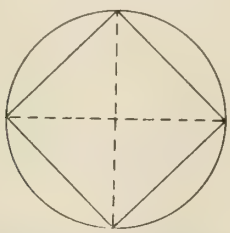
The boys in the first year now barely touch upon the subject of mechanical drawing but study the essential subjects leading up to it, thus laying a good foundation for future work. Useful geometrical constructions, elementary solid and descriptive geometry are taught. The instruction, being graphical, the same time gives the boys some practice in the use of instruments.

Second year boys will continue the study of geometry a little farther, and in addition will make free-hand sketches of models and from them make scale drawings.

The boys in the other years will advance further in that part of mechanical drawing essential to tradesmen. The making of free-hand sketches with the

views in proper relation to each other will be emphasized. Nearly all mechanical drawings as in the past will be made in pencil only, as more ground can be covered and they serve the purpose just as well. No drawings will be made by copying from blue prints, but a number of suitable exercises have been prepared, in which, for example, the plan and elevation of an object are given and the end view required.

To aid the teachers, and to make the instruction uniform over the whole system, an elaborate text book has been prepared and great pains have been taken in writing it to explain each step of each type of problem presented. It contains an abundance of drafting exercises, thus relieving the teachers from the difficult task of devising their own

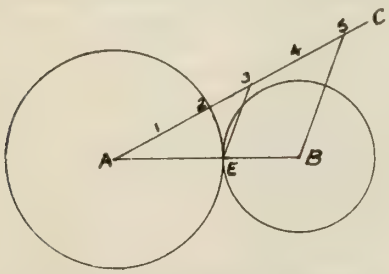


PROBLEM 23—PLANE GEOMETRY.

problems. The following extracts from the text book are typical of how the subjects are treated:

Problem 23, (Plane Geometry).—To inscribe a square within a circle.—Draw two diagonals at right angles to each other and join the points where the diagonals cut the circumference. (See sketch.)

Problem 24, (Plane Geometry).—Given the centres of two shafts, a certain distance apart, to connect them with two gears which will have one wheel making three revolutions while the other is making two.—Let A and B be centres of two shafts. From A draw the line AC at any angle, and upon it mark off five equal parts and number them. Join 5B and through No. 3 division draw a line parallel to 5B, cutting AB at E. AE and BE will be the radii of the pitch circles of gears required. Note.—The revolutions can be any number for each, but the principle if applied correctly will give the radii of both.



PROBLEM 24—PLANE GEOMETRY.

This problem will be found useful in connection with gear wheels, and is based upon Problem 19.

Problem 1, (Projections).—Draw the plan and elevation of a 2 in. line at right angles to the V.P. and parallel to the H.P.

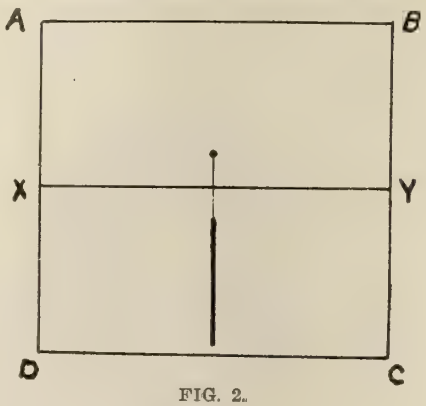


FIG. 2.

and ½ in. away from both planes.—Use a folded piece of paper to represent the planes and place the wire representing the line in the position named and decide what to do. The drawing when completed would be as seen at Fig. 2, the outside rectangle ABCD representing the sheet of paper. XY is the ground line, therefore AXYB would be the vertical plane and XDCY the horizontal plane. The light lines are called the projector lines, and are necessary to ensure the placing of the views in line with each other but at right angles to the plane of projection.

Problem 3, (Projections).—Draw the necessary views showing a trap-door, represented by a two-inch square when it is opened, so as to make an angle of 30 degrees with the floor, the hinged edge being at right angles to the V.P. Note.—The plan will show the square foreshortened lengthwise but still showing full depth.

### Sections.

Hitherto these lessons have explained how objects are projected as seen directly in front (elevation), and from above (plan), and therefore the outside appearance and surface of solids only have been represented. Frequently this is insufficient to convey a clear meaning of the shape of an object and in addition to the elevation and plan there are often other views necessary to show the interior. This is done by means of what is called "sectional drawing," that is, a drawing of what is seen when the solid is cut leaving a level surface.

### Mechanical Drawing.

All views in mechanical drawing, whether freehand or otherwise will be considered as having the object lying above the H.P. and in front of the V.P., and with their centre or main lines lying parallel to and at right angles to both planes.

To become efficient in sketching, practice drawing certain outlines with one stroke for a straight or circular line.

Freehand sketches will be made from each object showing all dimensions, and have each view placed in proper relation to each other.

When sketch is completed and passed as correct by the teacher the object will be put away and the mechanical drawing completed from the information contained in the freehand sketch.

No. 1—⅞ in. and 1 in. brake pin with 7-16 in. hole, to be drawn full size.

AN APPRENTICE SCHOOLHOUSE.

No. 2—Wrought iron link, to be drawn full size.

The examinations at the end of the session in this subject will be made on a fairer basis in future. It is likely first and second-year boys will have to solve a set of graphical problems which cover their work in the text book; while third, fourth and fifth-year apprentices will each be given a model and must make a sketch and workable drawing in a limited time.

Practical mechanics is taught one evening a week throughout the session. The aim kept in view in this subject is not to attempt work too advanced, but to train the average boy to apply

with the help of a text book a formula to the solution of any mathematical problem he is liable to run across in his every day work. The extent of the ground covered can be realized by studying the sample examination papers given below:—

**First Year Apprentices' Examination.—Practical Mechanics.**

1.—Find the sum of (a) 4.2700, 15.004, .9007 and 23; (b) ½, ⅜, 7-16, 9-32. (5)

2.—Subtract 7.462 from 9.005; 15 13-32 from 21. (5)

3.—Find the product of 623.4075 by 24.0259; ¾ x ½ x ¾ x ⅞. (6)

4.—Divide 357.84 by 25.6182; 17⅜ by 12½. (7)

5.—Extract the square root of 119025; 5.322249.

6.—Find the surface of a cylinder 23 in. diameter by 39 in. long. (9)

7.—Find the number of U.S. gallons of water, and the weight of the water in a semi-spherical vessel whose diameter is 36 in. (10)

8.—Find the area of a triangle whose base is 56 in. and height 78 in. (9)

9.—The diameters of two circles are 14 in. and 8 in. What is the difference in their circumferences? (9)

10.—Find the weight of a rectangular steel billet 4 ft. long, 14 in. wide, and 8 in. thick. (10)

11.—A locomotive boiler contains 217 tubes, 2 in. O.D., 11 ft. 6 in. long. Find the total heating surface (outside surface) of the tubes. (9)

12.—A cast iron ball and a steel ball each have a diameter of 8 in. Find the difference in weight of the balls. (12)

All questions can be attempted.

The value of each question is shown thus:—(9).

Put the number of your question before your work.

Sufficient details of your calculations must be given in order to show the methods employed in obtaining the results.

Write only on one side of your paper. —Time 2 hours.

**Second Year Apprentices' Examination. Practical Mechanics.**

1.—Multiply 3.00704 by 4.0205; ¾ by 5 1-9 by 7 1-5. (5)

2.—Reduce ⅜, 7-16, 5-32 and 11-64 to decimal fractions. (5)

3.—Extract the square root of 22,071.-204; 42.03. (8)

4.—(a) How many square yards, square feet and square inches are there in 156.738 square inches?

(b) Find the number of cubic inches in 12 cu. yds., 23 cu. ft. (9)

5.—A locomotive boiler contains 225 tubes, 2 in. O.D., 165 in. thick. Find the total area in square inches of the openings for the passage of the gases. (8)

6.—A lever 66 in. long has a weight of 48 lbs. on one end. The fulcrum is placed 8½ in. from the weight. What power must be supplied at the other end of the lever to balance it? (8)

7.—With an available power of 240 lbs., what weight can be lifted by a 3 cord pulley? (7)

8.—A train moves uniformly at a speed of 45 miles per hour. How long will it take it to go 1,200 ft.? (8)

9.—A shaft has a pulley 23 in. diameter keyed to it and revolves at the rate of 92 revolutions per minute. This drives another pulley 18 in. diameter. How many revolutions per minute will the latter pulley make? (9)

10.—A rectangular block is 4 ft. 3 in. long, 2 ft. 6 in. wide, and 3 ft. deep. Find (a) its surface, (b) its cubic contents. (11)

11.—The front cylinder head of a cylinder 23 in. diameter is held by 24 studs. If the pressure in the cylinder is 160 lbs. per square inch, what is the stress on each stud? (12)

12. A locomotive tender tank is to have a capacity of 7,000 U.S. gallons of water. It is to be 24 ft. long and 10 ft. wide inside. Find the depth. (10)

All questions can be attempted.

The value of each question is shown thus:—(9).

Put the number of your question before your work.

**Third Year Apprentices' Examination.—Practical Mechanics.**

1. The area of a triangle is 216 sq. inches and its perpendicular height is 24 inches. Find the base. (5)

2.—Extract the square root of $.000133225; \frac{15129}{182329}$. (6)

3.—The driving wheels of a locomotive are 73 in. diameter and the truck wheels 36 in. diameter. How many more revolutions will the truck wheels make in going 5 miles? (9)

4.—The outside dimensions of a rectangular box with covers made of oak 1 in. thick, are 7 ft. long, 8 ft. wide, and 9ft. deep. Find the capacity of the box and the number of square feet of lumber in it. (10)

5.—What force is necessary to raise a body weighing 120 lbs. with a six cord pulley? (6)

6.—How long would it take a train to go 240 miles with a velocity of 22 feet per second? (8)

7.—A lever 42 in. long has a weight 56 lbs. suspended from one end. What force must be applied at the other end to lift the weight if the fulcrum is 8 in. from the weight? (7)

8.—An iron casting measures 7 ft. 5 in. long by 3 ft. 10 in. wide by 7 in. thick. In this casting are cut two slots each running the whole length of the casting, one being 1 ft. wide by 1 in. deep, the other 8 in. wide by 1½ in. deep. What is the weight of the casting before and after the slots are cut? (9)

9.—A reservoir 150 ft. long by 65 ft. wide contains 13,500 gallons. Find the depth and weight of the water. (9)

10.—A train weighs 975 tons and the resistance is 10 lbs. per ton. Find the work done in drawing it 1½ miles at uniform speed. (9)

11.—The counterbalance on the driving wheel of a locomotive weighs 640 lbs. and the centre of gravity is 24 in. from the centre of the axle. What is the centrifugal force of the counterbalance when moving through 35 feet per second? (12)

12.—A hollow cylindrical cast iron column is 50 ft. high, outer diameter 5 ft. and inner diameter 3 ft. Find the weight of the column and cost of painting the outside surface at five cents per square foot. (10)

**Fourth Year Apprentices' Examination. Practical Mechanics.**

1.—The driving wheel of a locomotive is 72 in. in diameter and it makes 250 revolutions per minute. Find the speed of the locomotive in miles per hour. (6)

2.—The circumference of a circle and the sum of the sides of a square are the same, 7,744 inches. Find the area of each. (8)

3.—The area of a square is 162 sq. ft., 36½ sq. in. Find the length of the sides. (7)

4.—The distance from the fulcrum to the end of a lever, at which a force of 145 lbs. is applied, is 5 ft., and the distance from the fulcrum to the weight is 1½ in. How great a weight will the force lift? (8)

5.—A block of steel is triangular in shape with a base of 5 ft. 6 in., and height 4 ft. 3 in., and the block is 6 ft. 6 in. long. What is the weight of the block? (9)

6.—Two bodies A and B start from the same point and move in opposite directions. A moves at the rate of 15 ft. per second and B at the rate of 15 miles per hour. (a) What will be the distance between them at the end of 10 minutes? (b) How long before they will be a quarter of a mile apart? (10)

7.—A chain weighing 10 lbs. per foot of its length is 125 ft. long and hangs vertically; what work is done in winding up the chain on a drum? On raising the lower end to meet the upper. (8)

8.—A cast iron sphere 4 in. in diameter is revolved in a circle in which the centre of the sphere to the centre of the circle is 15 in. If the sphere makes 60 revolutions per minute, what is the tension of the string? (10)

9.—With a system of 7 pulleys, what

force must be applied to the free end of the rope to raise a weight of 2 tons? (6)

10.—A pulley 14 in. in diameter makes 140 revolutions per minute. Another pulley connected by a belt makes 45 revolutions per minute. Find its diameter. (7)

11.—(a) What do you understand by "Kinetic Energy?"

(b) A solid cast iron ball 8 in. in diameter has a velocity of 45 feet per second. What is its kinetic energy? (9)

12. The cylinders of a steam engine are 18 in. diameter by 24 in. stroke, and the mean effective pressure is 153 lbs. per square inch. Find the horse power if 275 strokes are made per minute. (12)

**Fifth Year Apprentices' Examination.—Practical Mechanics.**

1.—Find the outside surface, volume, and weight of a cast iron cylinder 23 in. O.D., 20 in. I.D., and 40 in. long. (7)

2.—A piece of metal 3 in. in diameter is being turned in a lathe, the spindle of which makes 25 revolutions per minute. Find the speed of cutting the metal. If it is desired to turn a 2 in. piece of metal at the same cutting speed, how many revolutions must the spindle make per minute? (10)

3.—What is the tractive power of a locomotive with cylinders 22½ in. diameter by 30 in. stroke, driving wheels 63 in. diameter, and boiler pressure 180 lbs. per square inch? (7)

4.—The diameter of a small ram of a hydraulic press is 2 in., and the diameter of the large ram is 7 in. The lever arm is 24 in. long, and the distance from the fulcrum to the small ram is 4 in. What power is necessary at the end of the lever to raise a weight of one ton? (8)

5.—(a) What do you understand by "Centre of Gravity?"

(b) Two bodies weigh 12 and 35 lbs. respectively and the distances between their centres of gravity is 38 in. Where is the centre of gravity of both bodies located? (7)

6.—A hammer head weighing 50 lbs. strikes with a velocity of 40 ft. per second and 25 blows per minute. What is the kinetic energy possessed by the hammer head per blow, and at what horse power does it work? (7)

7. In a steam engine the indicated horse power is 540, but it is known that 6 horse power is lost in overcoming friction, etc., in the engine. What percentage of the horse power is used for useful work? (8)

8. A loaded truck weighing 12 tons is pulled along a level track. If the resistances to motion are 11 lbs. per ton, find the work done in pulling the truck a distance of one mile. What is the horse power exerted. (8)

9.—(a) What is the hauling capacity of a locomotive having a weight of 179,000 lbs. on the driving wheels, the total weight of the engine and tender loaded being 340,000 lbs.?

(b) What is the adhesive weight of the locomotive? (8)

10.—(a) What do you understand by "Centrifugal Force?"

(b) A locomotive weighing 110 tons runs around a curve of 955 feet radius at a speed of 30 miles per hour. Find the centrifugal force. (8)

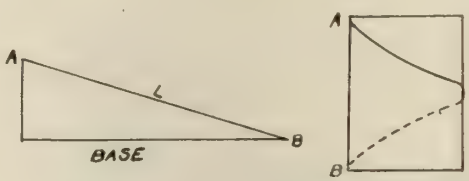
11.—(a) A weight of one ton is suspended by a sling chain. The length of each side of the chain is 18 feet and the height at the centre is 13 feet. What is the stress on each leg of the chain?

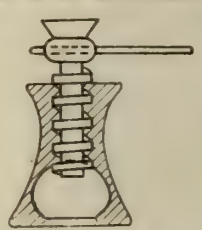
(b) What will be the stress on each leg if each side of the chain is 18 feet and the height decreased to 7 feet? (10)

12.—A train 300 feet long, travelling at the rate of 60 miles per hour, passes another train, 350 feet long, travelling at the rate of 40 miles per hour. How long do they take to clear each other (a) when travelling in the same direction, (b) when travelling in opposite directions? (12)

All questions can be attempted.

The value of each question is shown thus:—(9).





INCLINED PLANE AND SCREW.

Put the number of your question before your work.

Sufficient details of your calculations must be given in order to show the methods employed in obtaining the results.

Write only on one side of your paper.

For this course text books are used also, there being one for each year. Every apprentice has the use of one of these during the session and in fact any employe of the company may borrow one for review purposes at any time. They contain all the formulae dealt with in class and show how to use them. They also contain an abundance of practical problems to be solved in class. The following are typical quotations from these books:—

**Simple Multiplication.**

Multiplication is a short method of addition. Thus, if nine were to be multiplied by five, the answer would be 9 + 9 + 9 + 9 + 9 = 45. This method would not be convenient, and with the use of the multiplication table the question would simply be a mental one, thus 9 × 5 = 45.

**The Sphere.**

A sphere is a solid object having a curved surface, all points on which are an equal distance from a point within called the centre. The area of its surface is found by multiplying the square of the diameter by 3.1416 and this rule stated as a formula would be A = D × D × 3.1416.

Example.—A hole is punched through a ½ in. plate, the pressure being 36 tons. Find amount of work done. W = F × S; F = 36 × 2000; S = ½ of 1-12; therefore, W = 36 × 2000 × ½ × 1-12 = 3000 ft. lbs.

**The Screw.**

The screw is the last of the mechanical powers and if carefully observed it will be seen to be the same in principle as the inclined plane. A thread is cut around a cylindrical piece of metal; the distance between centre of threads being known as the pitch. Cut out in paper an inclined plane having as its base a length equal to the circumference of the cylinder around which it is proposed to cut a thread and having a height equal to the pitch of the threads. Place this around the cylinder and the screw thread will correspond to the side L on the inclined plane, or the hypotenuse of a right-angled triangle.

As in the case of the course in mechanical drawing, an examination is given at the end of the session on the course in practical mechanics. These examinations are set and conducted by the supervisor of apprentices, and the drawings and papers are marked by neutral examiners. This creates rivalry between the different stations to obtain the highest class average and encourages competition among the boys themselves. The marks made by each apprentice serve as a record of his efficiency, and the class averages are valuable to the superintendent of motive power and other officials connected with the apprenticeship system in comparing the efficiency of instruction at the various shops.

To increase the competition in these examinations various encouragements are given. Five hundred and ninety dollars are given as prizes each year, of which twenty-eight dollars are available to the best student. Diplomas of honor are awarded to each boy heading his local class, also to each class having the highest average, and to the seven ob-

taining the highest standing in each subject. Should one shop head the list in both subjects the apprentices at that station are given a free excursion to their choice of several destinations. As may be imagined, the competition in the past has been very keen, thus encouraging both teachers and pupils to take a greater interest in their work.

### Records of Apprentices.

To make the system of greatest value to any management, suitable records should be kept of the apprentices since they are to be the future mechanics and officials. This is especially true where there are so many apprentices as in a large railroad corporation.

The G. T. R. keeps a record of each boy's work and conduct in the shop and class room. The supervisor of apprentices records each boy's marks at the yearly examinations in drawing and practical mechanics, and points out from time to time to the superintendent of motive power and the master mechanics any boy who is doing exceptionally well in the school work. It is advisable to keep this record because few boys make skilled mechanics who are not bright at drawing and mathematics.

The apprentice instructor keeps a record of the apprentice's work in the shop showing the various gangs and departments worked in and the length of time in each; the boy's conduct and attendance when in those departments, and the results of examinations in shop practice. The boy's letter of application contains the information regarding his previous education. These records are valuable to the management in selecting young men for particular positions.

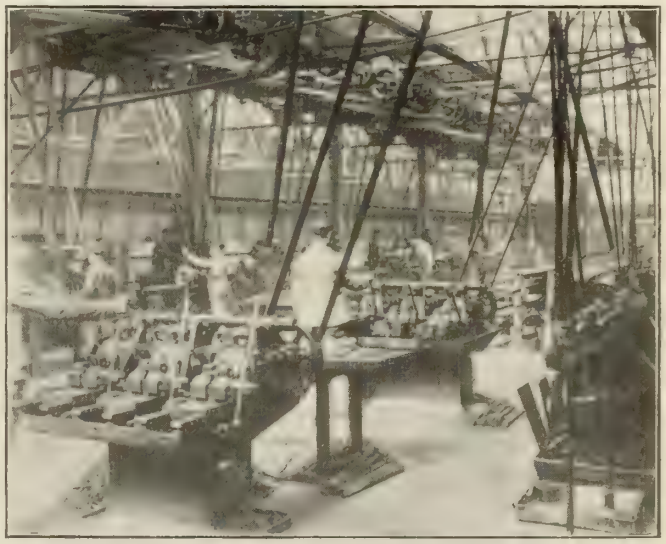
### Social Side of System.

The social problem is an important one for the management to handle. Social activity has two effects: it keeps the majority of the apprentices happy and contented with their chosen professions and it attracts other boys into the service. Get Harry Smith talking about the man-sized work he is doing, about the success of the Grand Trunk baseball and football teams, about the apprentices' banquets, excursions, etc., and about the dances he gets into in the winter, and you will not only keep Harry contented but also attract his friend Bill to become an apprentice, who perhaps had always looked upon the dark side of this profession—thinking only of the long working hours and dirty work. Hence it is to the company's advantage to foster social activity.

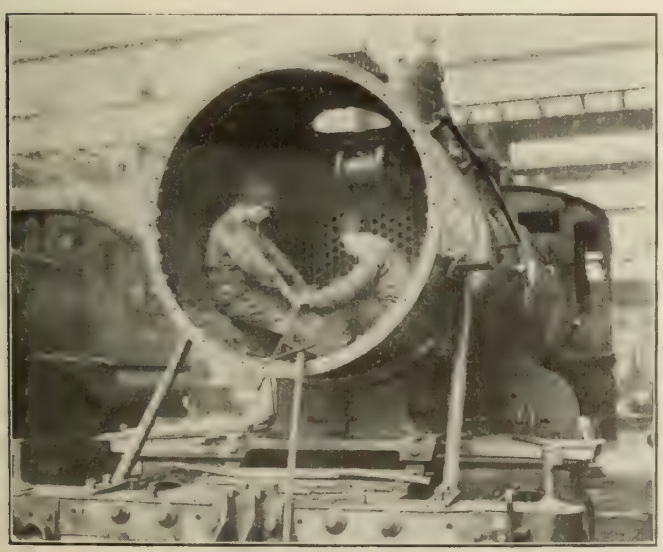
Social life among the apprentices of the Grand Trunk has reached a very desirable status. The employees have a first-class band at a number of stations, also hockey, baseball, football and cricket clubs in which a large number of apprentices take an active part.

At the larger shops, the apprentices

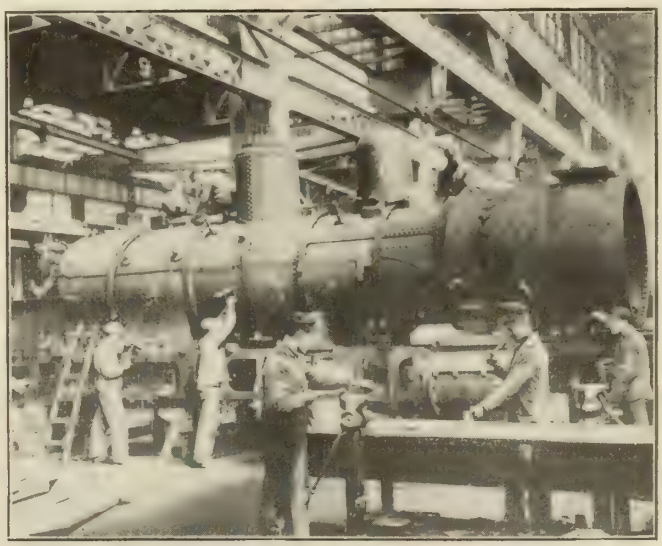
APPRENTICES AT WORK IN THE AIR-BRAKE DEPARTMENT.



APPRENTICES WORKING IN BOLT DEPARTMENT.



APPRENTICES FITTING THE FRONT END.



THE APPRENTICE REBUILD GANG.

have an annual banquet which is run entirely by themselves, each paying a small amount to help defray expenses. Friends and representatives from other shops are invited. A musical programme is provided and speeches are made by a number of boys selected from each class, also by graduate apprentices and prominent men interested in industrial education. Besides being a social function, this feature is also a source of education.

The apprentices have a fund which they maintain for such expenses as the purchase of models for the class-room or flowers for a fellow apprentice who may be sick or has been bereaved. Prize money won by the class as a whole or by showing drawings at exhibitions is usually voted towards this fund.

APPRENTICE CLASS ROOMS TURNED INTO A BANQUET HALL.

Pass privileges are extended to all apprentices, but more generously to those living away from home, it being the company's desire to keep the boys in close touch with their parents. The free excursion, in a coach by themselves, given the apprentices of the shop leading in the school work, is an outing greatly coveted by the boys.

It is also the company's desire to make the boys present a neat appearance both on the street and in the shop, and to feel proud of the fact that they are G. T. R. apprentices. Many a boy, on a Monday morning, has been sent home for a clean pair of overalls, and no apprentice need go home with dirty hands and face with the excuse that there are no wash-basins, no towel lockers, and no hot water in the shops.

If all similar and kindred concerns were as successful in looking after the social life of their employees, and were as strict and painstaking in keeping their shops clean and sanitary, there would be less heard of "boilermakers and greasy mechanics."

**Results From the System.**

This scheme of making their own mechanics has been a paying enterprise for the G. T. R. from the very start. In the year 1901, the company spent $275 on the apprentices in the motive power department, while in 1913 it quite willingly expended nearly $8,000, although during the elapsed period the number of employees in the department increased only from about 5,500 to 10,000. It is money well invested, for the company's greatest asset lies in its apprentices and young men, as by the proper training of their workmen, they eliminate to a large extent the waste due to abuse of machinery and tools, as well as a low standard of, and spoiled, work. To-day, approximately 100 apprentices graduate each year, of which number about 90 per cent. remain in service for at least one year, and a high percentage stay much longer. Every inducement is offered to keep graduates in service. The apprenticeship system is solving the problem of providing a supply of competent workmen and supervisors—a matter of great importance to the company.

The boys also derive many benefits from the system. During apprenticeship, the boy is paid wages sufficient to board and clothe himself, and has to pay out nothing to enter the service, nor for tuition fees and books. He enjoys an active social life among those of his own age and with similar ideals in life. His instruction in the school and shop is guided by competent men along lines directly connected with his future occupation. Each graduate is given a bonus of twenty-five dollars and a certificate of apprenticeship. Again, a graduate apprentice is given first chance whenever there is an opening for a chargeman, foreman or master mechanic.

In the future even greater results will be obtained as the outcome of experience and research in preparing apprentices for their future work. At the present time a new plan is being tried out in which the students are taught by correspondence supplemented by periodic visits from travelling instructors. This is being used for those classes where there are not sufficient number of apprentices to have a special instructor or where there is no competent instructor available. This should be very successful in giving every apprentice an equal opportunity to make good, no matter whether he be in a large repair shop or in a small roundhouse.

## B. C. MANUFACTURERS' ASSOCIATION.

BUREAUS are to be established in London at once and in Paris and Petrograd later in connection with the activities of the B. C. Manufacturers' Association to secure a share of the business resultant on the war. The organization now has a representative in Ottawa who is keeping constantly in touch with the militia department and advising provincial manufacturers of goods required for the Canadian troops as well as of intending purchases by the Allies. H. M. Daly, a son of the late Hon. T. Mayne Daly, is acting as the association's representative at Ottawa.

A. E. Howard of Vancouver has been appointed to represent the B.C. Manufacturers' interests in London, and he will leave at an early date to assume his duties. Full lines of samples of British Columbia products will be taken over by the agent and an effort will be made to submit bids on the goods required that the province is able to supply. Particular attention will be paid to the lumber business.

After the London office has been organized Mr. Howard will make arrangements for representation of the B. C. Manufacturers at Paris and Petrograd. The prospects for the development of trade betwen British Columbia and Russia are very good in the estimation of local manufacturers. Shipments can be sent from Vancouver to Vladivostock and thence across Siberia by the Government Railway.

**A Sufficient Lifter.**—A long-handled small magnet has proven a great machine-shop convenience, for picking up small nuts and other articles of iron or steel in places difficult to reach. Little objects not of iron or steel are misplaced also, and now it is proposed to secure these by a variation of the vacuum cleaner, a rubber suction cup at the end of a hollow handle being connected to the pipe of an exhaust pump, with a small thumb-valve for control.

## A UNIQUE SUB-PRESS DIE CONSTRUCTION.

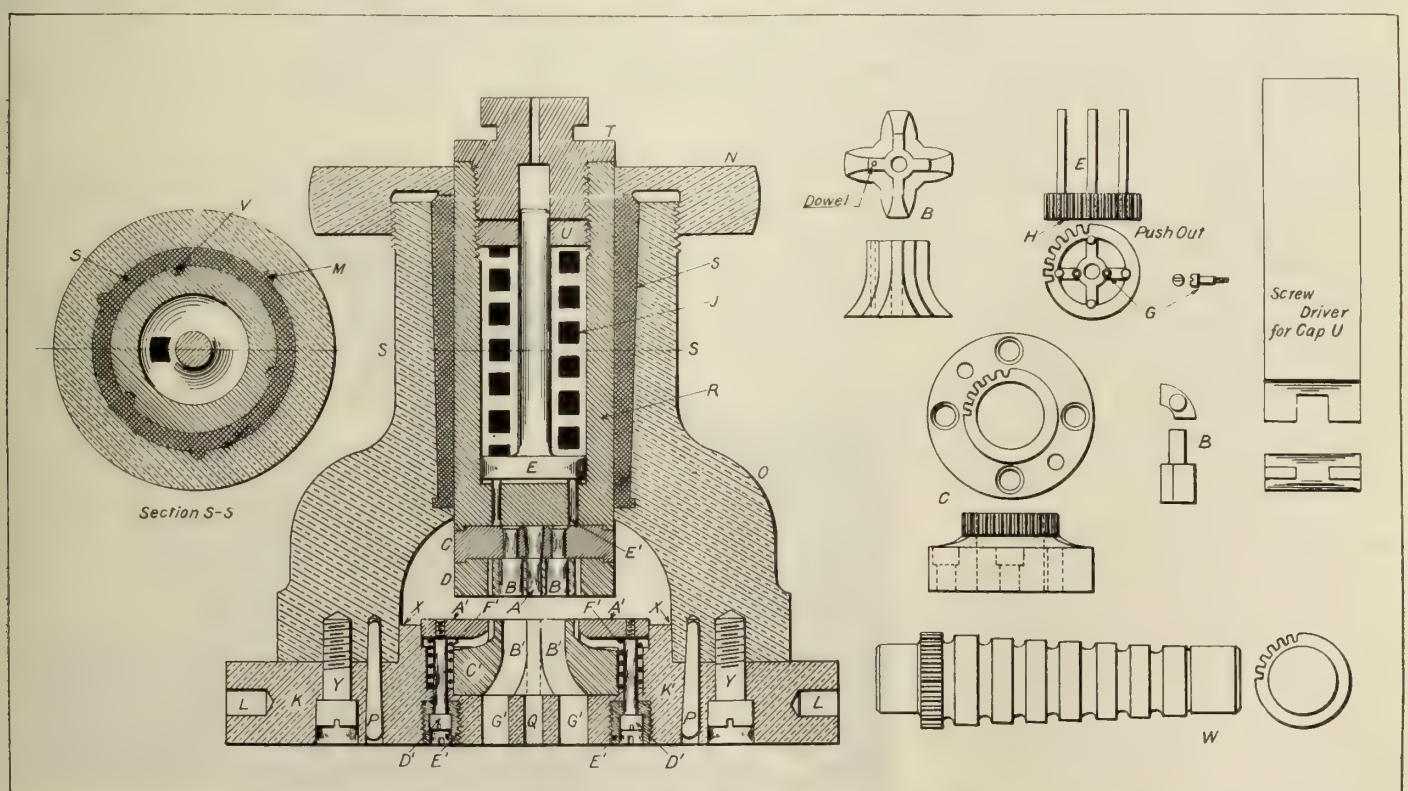
By A. L. Monrad.

FOR close, accurate, clear-edged punching a sub-press die is a most economical and satisfactory tool. The writer has selected, for illustration, a four-armed brass gear wheel. Although an innocent-looking piece, it required considerable accuracy. The gear wheels are blanked from a single strip, 0.032-inch thick; are returned again into the strip by the shedder and are carried along out of the press as the strip is fed through. Care should be taken to select a proper size or number sub-press and, as the diameter of the gear wheel is 1.189 inch, a No. 3 press is most suitable.

Having selected a sub-press with its proper cap, the frame O is held in the chuck on a lathe, and the bottom faced off, while the recess XX is bored, 1 degree tapered, and made a snug fit to correspond with the step on the base K on the lower part of the sub-press. This is also held in a chuck and the bottom faced off. Two ⅜-inch holes LL are drilled, one on each side of the base, to receive finger straps to secure it firmly on a face-plate when facing, turning and boring the top side. The centre is bored out a push fit to receive the stripper plate A', blanking punch B', and a ¼-inch hole Q drilled, bored and reamed completely through it to allow scrap punchings to fall to the floor.

Two ⅜-inch holes Y are next located, drilled and counter-bored in the base K, these holes being then transferred into the frame O and tap drilled in about ½-inch. When base and frame are assembled, holes are drilled and reamed for the dowel pins PP. The sub-press die is now ready to be placed together and strapped on to a face-plate. A plug centre is turned while in the spindle of the lathe to fit the ¼-inch hole A in the base. On this plug the sub-press is clamped centrally on the face-plate, care being taken that the face runs absolutely true. In this position the frame is bored out to a taper of about half-inch per foot, and the bottom hole is bored parallel to fit the plunger R. With the same taper setting of the lathe, while it is locked by means of the back gears, three circular grooves M are splined the entire length of the bore, as shown in sections SS, by moving the lathe carriage back and forth. The spacing of these grooves is immaterial, as they act only as a key for the babbitt S. The end of the frame is now turned and threaded to receive the cap N, and this is screwed on securely and the hole in the cap bored straight to a snug fit for the plunger R. This is done in order to line the holes perfectly central with the die construction details, bore, frame and base.

The plunger R is made of low-grade tool steel. It is first rough turned on the outside, then placed in a centre rest and a deep hole is bored to a free fit for piston F. The end of this hole is threaded to a tight fit for button T. Threading should be carried one inch deeper than the thread of the button in order to allow for the tension cap U. By adjusting this cap, sufficient tension can be placed on the stripper spring J to force the blank back into the stock again after being punched out. This, of course, takes place on the return or upward stroke of the press. The button T is made of a low-grade tool steel, an eight-inch hole being drilled through its centre to let the air out from the inside during operations. Centre ream both ends and turn the head to a free fit in the T-slot of the press. The other end is threaded to a forced fit and square shoulder in plunger R. The bottom end of button T is counter-bored to a free fit for piston F. With the button in the plunger and a lathe dog on the T-end of button, the plunger is ground (not turned) perfectly parallel to a snug fit for the hole in the cap N. Three irregular 3-16-inch radii,



UNIQUE SUB-PRESS DIE CONSTRUCTION FEATURES.

about 1-16-inch deep grooves V, are cut the entire length of the plunger. These will match convex projections of the babbitt S and prevent a careless operator from entering it the wrong way. It is very essential that these grooves be milled absolutely parallel with the axis of the bore of the plunger. Therefore, try it on a turned bar with a sharp V cutter. It can easily be detected with the aid of a magnifying glass if its cuts parallel both sideways and for depth.

A machinery steel ring is turned and bored to a force fit on the end of the plunger R and about one inch wide. Adjust the centre rest to this ring with the plunger in proper place, using the plunger as an arbor. This is done in order to prevent the ground surface of the plunger being marked or injured from the jaws of the steady rest. Now bore out the recess on the end of the plunger R to a snug fit in the punch holder C. The ejector spring J is made from a good grade tool steel and spring tempered to a very dark blue. It can either be turned or rolled from a 5-16-inch square stock, leaving plenty of room to float around between the piston F and plunger R. The piston F is made of tool steel, and the disc end only is hardened to a dark straw color. It is turned to a free fit in the plunger bottom and tension cap U, the disc end being faced off by grinding.

The punch holder C is made of low-grade tool steel and not hardened. It has a recess on each side about 1-16-inch deep to a good fit on the end of plunger R and the die D. The holder is screwed and dowelled to the plunger not shown in the assembly drawing. The shanks on punches B should be riveted on top into holder C, after being fitted and located properly and hardened to a light straw color. The shank on the centre punch A is tapered as shown. This is done so it will not pull out, and is also hardened to a straw color.

The die D is made of the best grade die steel held up with four screws and dowelled into the holder C; great care should be taken to have the gear teeth broached central with the die. This was done by making seven broaches, as shown at W. The steps should be so spaced that before one stops cutting the other should take hold. In the last two or three steps it must not cut any more than .0005-inch at a chip for the finishing broach, but in the roughers the cut should be about .001 inch. They should be backed off very slightly on top and finished with a good sharp gear cutter, having the milling machine centres dead parallel. A very thin slot, about 0.020 inch, should be cut through the side of the screw holes from the outside diameter in order to prevent cracking the die in the hradening and draw the temper to a light straw color.

The push-out E is made of tool steel and spring tempered. This goes up in the die and fills the spaces between die D and punches A and B, the stems E going up against piston F and kept from dropping out by the two ⅛-inch shoulder screws G. These are screwed into the holder C against the shoulder, and the heads counter-bored into push-out gear plate H. The counter-bored holes should

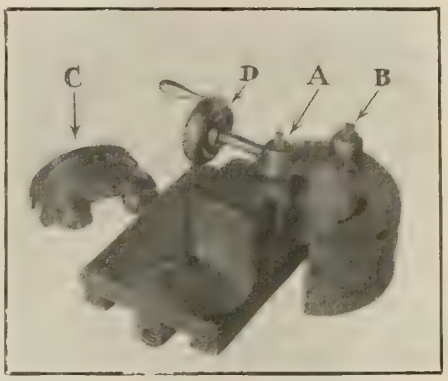


FIG. 12 ANOTHER HANDWHEEL TURNER.

be 1-16-inch deeper than the whole length of the screw and the push-out about ⅛ inch thinner than the die. The punches BB do not have to fit the push-out as close as they do the die, but have a rather easy sliding fit. When the brass gear is punched is shoves H upwards, forcing piston F against spring J, as shown, until the plunger R starts back. The spring J forces push-out H down again, thus pushing the blank out of the die and back into stock from where it has just been punched. Now when the tension is on spring J, the piston F will rest on bottom of the hole in the plunger R. In this position the pins E should be trimmed off until push-out H is flush on the face with die D. The screws G should now shoulder on C and H at the same time. This final assembling is generally done after all parts are hardened, ground and lapped, but in this particular case very few parts are so constructed to permit it to be ground unless a master plate is made, which means a considerable expense, unless duplicates of the same die or parts are wanted.

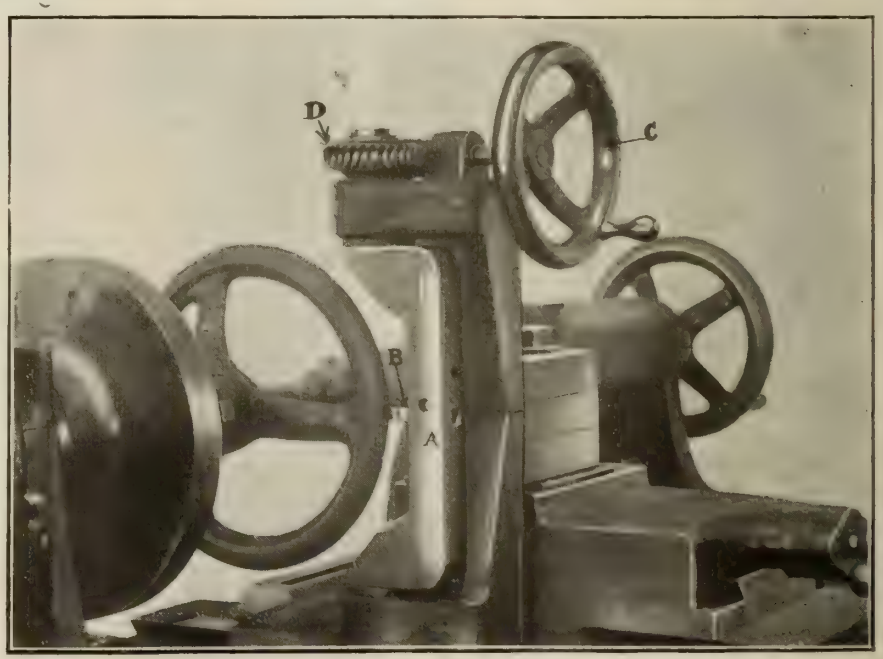
The punch construction will be featured in our next issue.

## DEVICES FOR FINISHING SPHERICAL SURFACES.

By Avery E. Granville.

THE finishing of handwheel rims is often a problem and in Fig. 11 is shown one solution. The handwheel is mounted on a mandrel and placed between the lathe centers. A cutting tool B is carried in a swinging yoke A mounted in a bracket bolted to the tool slide. The yoke is given a rotary motion by means of the worm gear D and a worm operated by the handwheel C.

Another handwheel turning device intended to be placed on a lathe cross-slide is shown in Fig. 12. Two cutting tools are carried in the tool posts A and B, so that it is only necessary to make a quarter turn to surface off a rim. The toolposts are mounted in a segment exactly like the one shown at C. A worm operated by the handle D gives the rotary movement to the worm gear segment. The reason that the segment C is shown is that the two segments were originally made in one piece and then cut in half. It was easier to machine in this way and, in case anything happens to the segment in use, another is ready to put in its place.



TURNING A HAND WHEEL.

# Series of Practical Questions and Answers for Mechanics

*Every care is being taken to include only pertinent, practical questions, and give same direct reliable answers. Catch questions will be avoided. Arithmetic, consisting of simple addition, subtraction, multiplication and division will be found a useful companion study.*

## KEYS AND KEYWAYS.

LIKE a number of other very much-used parts of machinery, we have no standards for key and keyways, each large or small plant adopting rules of its own. A common practice is for the draughtsman to make up a sheet upon which the dimensions of keyways for all sizes of shafting in use are given in order, and the sheet is hung up convenient to the milling machine or key-seater operator. These sizes, obtained by the formula adopted by the draughtsman, become the standards of the plant.

Designers usually adopt some empirical rule for the dimensions of keys, numbers of which can be found in most any engineers' hand-book. The keys ordinarily met with in the shop may be divided into two classes, the taper sunk key and the feather key, and simple rules governing these are about all the average mechanic has occasion to remember. By these rules the size of the keyway is made proportional to the size of the shaft regardless to the load carried by it, so that the designer must look out for light or excessive loads by making the hubs shorter or longer.

In plants where a large amount of mill work and such like is done, it is found convenient to make up keys in large batches to standard dimensions. Likewise, the hubs of pulleys are made to standard lengths to correspond. Thus ⅝-in. keys and hubs would be limited to 3, 4, 5 and 6-inch lengths, and the man cutting the key-seat in the hub delivers his work with a suitable key.

The ordinary sunk taper key is most used, as it provides resistance, not only against torsional stress, but axial motion as well. It should be well fitted both side-ways and top and bottom. All dimensions should refer to the large end of the key. A very serviceable and much-used rule for the dimensions of these keyways is as follows: The width of the keyway is made ¼ of the shaft diameter. The depth of the keyway in the shaft is made equal to ¼ of its width and the depth in the pulley is made equal to ½ of its width. This means that the key thickness is equal to ¾ of its width and its width is ¼ of the shaft diameter. One advantage of thus dimensioning the keys is that stock can be bought of approximately the correct sizes. Thus 1-in. x ¾-in. steel will make 1-in. keys with the minimum of waste.

Another rule very similar to this makes the thickness equal to 1-6 the shaft diameter. This may possibly give a slightly better value but to divide 16ths by 6 is slightly inconvenient for many mechanics. Other such rules are width = ¼ diameter + ⅛ in. Thickness, ⅛ diameter + ⅛ inch. Also, width = 3-16 diameter + 1-16 inch; thickness = ⅛ diameter + ⅛ inch.

* * *

**Question.**—According to the first rule, what should be the dimensions of the keyways in a 3 7-16 shaft and a coupling to fasten to it?

**Answer.**—Width of keyway $= \frac{3\ 7\text{-}16}{4} =$

$\frac{55}{16\times4} = \frac{55}{64}$ to nearest 16th, ⅞-inch key.

Depth of keyway in shaft $= \frac{7}{8\times4} =$

$\frac{7}{32}$ inch.

Depth of keyway in coupling $= \frac{7}{8\times2}$

= 7-16 inch.

Thickness of key at large end is 7-32 + 7-16 = 21-32 inch.

* * *

**Question**—What would be the dimensions of a key for a 3-7-16 shaft, according to the second rule?

**Answer.**—Width of key = 3 7-16 ÷ 4

$\frac{55}{64}$ = to nearest 16th, ⅞ inch.

Thichkness of key = 3 7-16 ÷ 6 = $\frac{55}{96}$ = , to nearest thirty-second, 19-32 in.

* * *

It will be noted that the most variable dimension is the thickness. In the case of a feather key which has no bearing on top, the key is usually made square. As the crushing resistance is approximately twice the shearing resistance of the metal, this would seem to be the proper form of key. With a sunk key fitted top and bottom, however, a wedging action causes the crushing surface to be extended from the sides over the top and bottom so that the thickness is really not so important a dimension as the width, which determines the shearing strength.

* * *

**Question.**—The coupling of a 2-15-16 shaft has to transmit its full strength. What should be the dimensions of a key for this purpose?

**Answer.**—The torsional strength of a shaft is represented by the formula $\frac{d^3S\ 3.1416}{16} = T$ where d = diameter of shaft and S = shearing strength of the material. For a 2-15-16 shaft this becomes:

$$\frac{(2\ 15\text{-}16)^3 \times 50{,}000 \times 3.1416}{16}$$

This acts upon the key at a distance from the centre of the shaft equal to the radius; or, the force becomes

$$\frac{(2\ 15\text{-}16)^3 \times 50{,}000 \times 3.1416}{16 \times 1\ 15\text{-}32}$$

= 169.406 pounds tending to shear the key.

The shearing resistance per inch of a ¾-inch key is 50,000 × 1 × ¾ = 37,500 pounds. The length of the key and hub is $\frac{169406}{37500} = 4.5$ inches.

* * *

**Question.**—What should be the dimensions of a key to transmit the full strength of a 1 7-16 cold rolled steel shaft?

**Answer.**—The width of the key would be 1 7-16 ÷ 4 = ⅜ inch to nearest sixteenth.

A very good formula for the length of key where key and shaft are of the same material is, $L = \frac{d^2 \times 3.1416}{8 \times W}$ where d = shaft diameter and W = key width.

For the above, this becomes

$$\frac{1\ 7\text{-}32 \times 1\ 7\text{-}32 \times 3.1416}{⅜ \times 8} = 1.55 \text{ inches.}$$

The hub would actually be made somewhat longer than this.

* * *

**Question.**—What would be the dimensions of a cold rolled steel key for a 4½-inch cast iron shaft?

**Answer.** — The general formula for keys and shafts of different materials is,

$$L = \frac{d^2 \times 3.1416 \times Ss}{8 \times W \times S's}$$, where L = length of key, d = diameter of shaft, Ss = shearing strength of shaft material, W = width of key and S's = shearing

strength of key material. Substituting values, this becomes

$$\text{Length} = \frac{20.25 \times 3.1416 \times 18000}{8 \times 1.125 \times 50000} = 2.57 \text{ in.}$$

* * *

**Question.**—A lever with a suitable hub at one end is fastened to a 2-inch steel pipe with a taper pin. What should be the mean diameter of the pin to take the full strength of the pipe, assuming that drilling the hole reduces its strength by 10 per cent.?

**Answer.**—Outer diameter of 2-inch pipe = 2.375 inches. Inside diameter = 2.067 inches. Torsional strength of a hollow shaft is

$$T = \frac{(D^4 - d^4)}{D} \times \frac{3.1416 \times Ss}{16}$$

at the circumference of the pipe or shearing point of the pin this force becomes

$$\left(\frac{D^4 - d^4}{D}\right) \times \frac{3.1416 \times Ss}{16} \times \frac{2}{D}$$

in which D = large diameter, d = small diameter and Ss = shearing strength of pipe material. Substituting values, we have

$$\frac{13.562}{2.375} \times \frac{3.1416 \times 50000}{16} \times \frac{2}{2.375} = 47.212$$

pounds. 47.212, less 10 per cent. = 47,212—4,721 = 42,491 pounds. Shearing area required $= \frac{42{,}491}{50{,}000} = .8498$ sq. in. Pin is in double shear. Cross sectional area required $= \frac{.8498}{2} = .4249$ square inch.

Mean diameter of pin is, therefore, $\sqrt{\frac{.4249}{.7854}} = \sqrt{.5409} = .735$, or very nearly $\frac{3}{4}$ of an inch.

## HIGH-GRADE STEEL MANUFACTURE IN CANADA.

M. J. BUTLER, managing director, the Armstrong-Whitworth Co. of Canada, takes exception to the statement made by several steel importers that high grades of steel are not being produced in Canada.

"While for a long time fine grades, such as vanadium steel and high tension machine steel, were not produced in Canada," says Mr. Butler, "they are now being manufactured at our Longueuil works. We hope that the imposition of this new war duty will not advance the price, but of course that will depend upon many circumstances which cannot be foreseen in war times. Our firm has started the manufacture of high-grade steel goods, and while we have accidentally fallen into the benefit of this unforeseen war tariff, it will undoubtedly aid in the establishment of our market, and we shall produce these special grades of steel in sufficient quantities to supply the Canadian market."

Mr. Butler stated that while the Armstrong-Whitworth people were not as yet producing steel tyres for locomotives, it was about the only thing they did not turn out. They, however, were manufacturing the special grade of steel required for steel tyres, and he had no doubt that before long, as a result of the new tariff, these tyres would be made in Canada.

"There is no doubt," said Mr. Butler, "that the new general war tariff will result in the production of many steel supplies in Canada which have hitherto been imported either from Germany, Great Britain or the United States, and Canadian business and Canadian labor will be the gainer thereby."

## PISTON RING TROUBLE

**Question.**—We are at present turning out a quantity of piston rings varying from 3/16 in. to 5/16 in. in thickness by 6 in. in length, using high grade scrap, No. 1 Eglinton pig and Georgia coke, analysis of the latter herewith. The proportion of scrap to pig is 2 to 1. In almost every instance pin-holes and blow-holes develop below the skin of the casting. We would greatly appreciate your interest in suggesting the cause and at same time a remedy for the trouble.—A. & McK.

**No. 1 Eglinton Pig.**

| | |
|---|---|
| Silicon | 3.000% |
| Sulphur | .015% |
| Combined carbon | .440% |
| Specific carbon | 3.060% |
| Phosphorus | .793% |
| Manganese | 1.800% |
| Iron (by difference) | 90.892% |

**Coke.**

| | |
|---|---|
| Moisture | .30% |
| Volatile | 2.17% |
| Ash | 6.26% |
| Sulphur | .76% |
| Carbon | 90.48% |

**Answer.**—The following are two analyses which have given good results for piston rings:—

**No. 1 Analysis.**

Silicon, 1.50 to 2 per cent.; sulphur, 0.06 to 0.08 per cent.; phosphorus, 0.40 to 0.60 per cent.; manganese, 0.45 to 0.60 per cent.; graphitic carbon, 3.50 per cent.; combined carbon, 0.45 to 0.55 per cent.

**No. 2 Analysis.**

Silicon, 1.50 to 2.0 per cent.; sulphur, 0.08 per cent.; phosphorus, 0.30 to 0.50 per cent.; manganese, 0.45 per cent. to 0.60 per cent., and graphitic carbon low.

In these analyses, the high perecentage of silicon is for the lighter castings and low percentage for the heavier one. From investigation of your trouble it is apparent that there is an excess of sulphur in some of the materials in your mixture. Your pig iron is also too high in silicon, which causes you to use a large percentage of scrap, and as you seem to have no analyses of the latter, I think it is probably responsible for most of your trouble.

In making the moulds for these castings, the moulding sand should be worked as dry as possible. Use a good skim gate and cut a flow-off-riser on the opposite side of the mould from the gate, this allows the gas and steam that is generated when pouring to escape, and lessens the chance of blow-holes. See that the moulds are well vented and pour with good hot iron. The addition of one pound of 80 per cent. ferro manganese to every 100 lbs. of your present mixture will overcome your pin-hole and blow-hole difficulty as it will eliminate the gases that cause same. It should be added in the ladle, and stirred to mix it wtih the molten iron. This will give you a tough, close-grained iron that will machine up quite smooth. When slagging your cupola, use about 40 lbs. of good limestone to each ton of metal melted, as this also helps to throw off the impurities from the iron.—R. Micks.

**Oxidising Sheets.**—Oxidising steel or iron sheets so that they will have a uniform bluish color instead of the varying colors produced by the ordinary processes of annealing, is the subject of a patent—United States, 1,115,281, October 27th, 1914—granted to John E. Carnahan and Arthur J. Maskrey, Canton, Ohio. The ordinary sand-sealed annealing box is enclosed in another sand-sealed box, which constitutes the main point in the invention. By conducting the annealing in one box enclosed by another, it is found that the subsequent separation and oxidation results in a substantially uniform color throughout each sheet and the prevention of an excessively deep scale at or near the edges of the sheets. This is due to the more uniform temperature in the second box and to the fact that the sheets are better protected from the products of combustion.

**Regina, Sask.**—At a recent meting of the Board of Trade the following officers were re-elected: President, S. C. Burton; vice-president, E. A. McCallum; second vice-president, F. J. James, and secretary, L. T. McDonald.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## NEW MULTIPLE SPINDLE BEVEL GEAR ROUGHING SHAPER.

OUR illustrations show a new multiple spindle bevel gear roughing shaper, designed and manufactured by Gould — Eberhardt, Newark, N.J. The principal function of the machine is to take care of the roughing or stocking out of bevel gears preparatory to having them finished on a bevel gear planer. As the stocking out consumes most of the time in cutting a bevel gear ordinarily done by the gear planer, and because the latter machine is so much more expensive than the roughing shaper, it will be seen that it is much more economical to have the roughing done on the roughing shaper, and the finishing on the gear planer.

The machine is particularly adapted to roughing out automobile differential steel bevel gears that have projecting hubs on the cone or small end of gear, and which would prevent them from being roughed in the ordinary simple disc cutter type gear cutting machine, as in this latter, the rotary cutter would be unable to cut the entire face of the gear on account of the hub interfering with the diameter of the cutter.

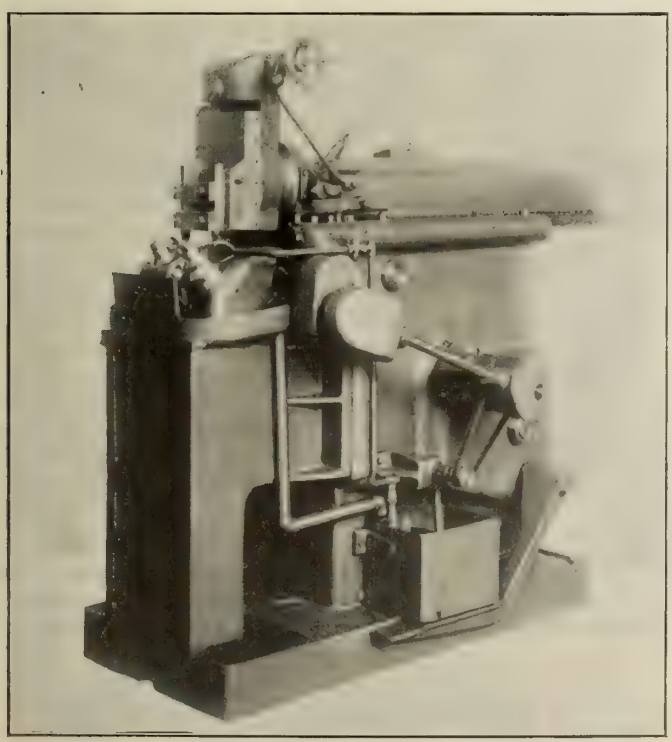
To accomplish the above work, the high-duty shaper lends itself satisfactorily on account of its high number of metal removing strokes, and it has been modified so as to allow one or two bevel gear blanks to be rigidly held at the proper angle and indexed at every return stroke of the ram. Again, the shaper head is automatically fed down at each stroke until the proper depth is reached, and then the feed is automatically thrown out and the blanks removed. The machine makes 100 cutting strokes per minute.

The most important feature of this shaper is the new style head which has been designed with a very efficient cam feed arrangement. Heretofore, the down or vertical feed to the head has been operated by means of a vertical feed screw, but in the present construction the feed screw has been eliminated and the cutting strains are thereby more effectively controlled by the cam feed construction. In addition, the amount of feed can be varied according to the location of cutting tool in the gear blank; that is, when the cutting tool is just entering the blank, the feed is greatest and, as the tool gradually feeds deeper into the blank, the feed is decreased. This not only relieves the machine and tool of the heavy duty which would otherwise be necessary if the downward feed were constant from start to finish, but it produces a higher finish job, as a very fine feed is automatically taking place when the tool is in full depth of tooth.

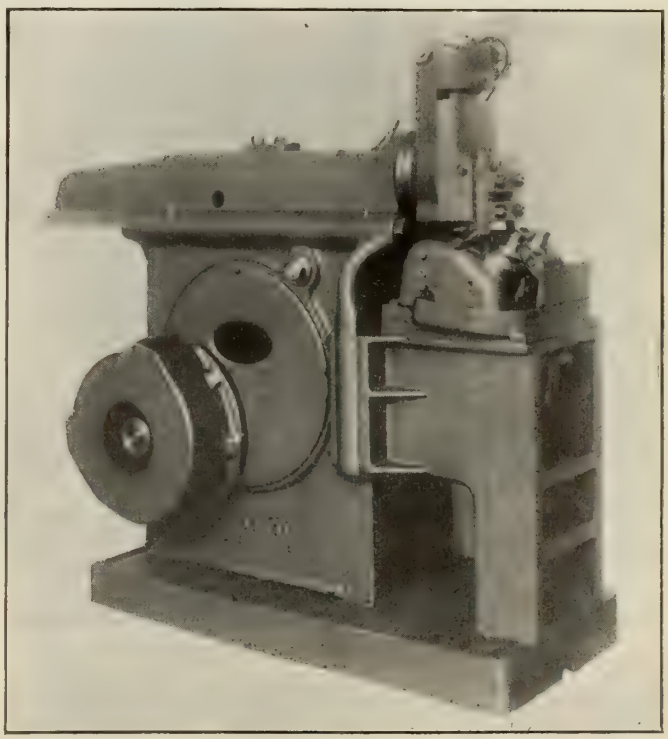
A new and efficient construction of main lever arm is employed, and is designed according to the first order of levers instead of the third order. The lever link is located on the top of the lever so as to take up the lost motion that takes place in operating the ram. Only two gears are used, and these are made of steel. The machine is driven by single pulley drive.

The principle of construction adopted is that of the high-duty shaper. The regular cross-head slide and table have been removed and a special work-head, with an indexing mechanism, has been substituted in their place. This work-head may be arranged so as to cut one or two gears at a time up to the capacity of the machine, with suitable means for holding the blanks rigidly and lubricating the tools, and so that they can be removed rapidly when finished and replaced with new blanks. The illustrations show two nickel steel 20-teeth, 6-pitch, ¾-in. face bevel gears being roughed out at one time, in 6¼ minutes each. They have projecting hubs, and to remove the chips that accumulate in the groove between the projecting hub and the inside face of the gears, two hook tools have been provided that fit in the groove under spring tension. These can be easily thrown out of position when taking off the gear.

The indexing of the blank from one tooth to the next consecutive tooth takes place at every return stroke of the



MULTIPLE SPINDLE BEVEL GEAR ROUGHING SHAPER.



MULTIPLE SPINDLE BEVEL GEAR ROUGHING SHAPER.

ram; that is, when the tool is clear of the work and, therefore, is positively controlled by the reciprocating of the ram. After the indexing has taken place and before the tool engages the work, means are provided to lock the work spindles, so that the blank is securely held while under cut. As the ram returns and the tool is out of the cut, the automatic vertical feed to head takes place, and so continues to operate until the feed cam has made one revolution and, in revolving, comes to the point where the feed started; then the head jumps out of the cut, and is ready to start on another set of blanks.

## AUTOMATIC FACING TOOL FOR DRILL PRESS OR MILLING MACHINE.

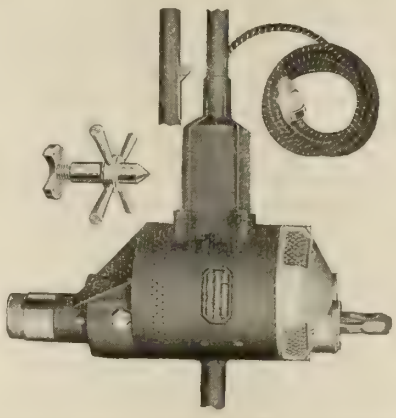
WITH this facing tool it is possible to do work easily and rapidly on a drill press or milling machine, and which by ordinary methods is more or less difficult and slow. To spot face a boss or similar work has always been a somewhat difficult task, the ordinary flat spotfacing tools being hard to keep in order, besides it is difficult to get them started on the work, on account of getting under the scale of the iron. By the time the tool is forced through the scale, the cutting edge is ruined, and regrinding or replacing of the tool becomes necessary before the job can be finished.

The purpose of this tool is to overcome the above difficulty. It operates on the same principle as facing on a lathe, the tool taking an ordinary lathe tool bit. The facing starts at the centre and the tool is fed outward, from which it will be noticed that the latter gets beneath the scale at the start and breaks it away as it is fed across the work. The tool bit is quite as easily taken out and sharpened as the tool bit is removed from any lathe tool holder and sharpened.

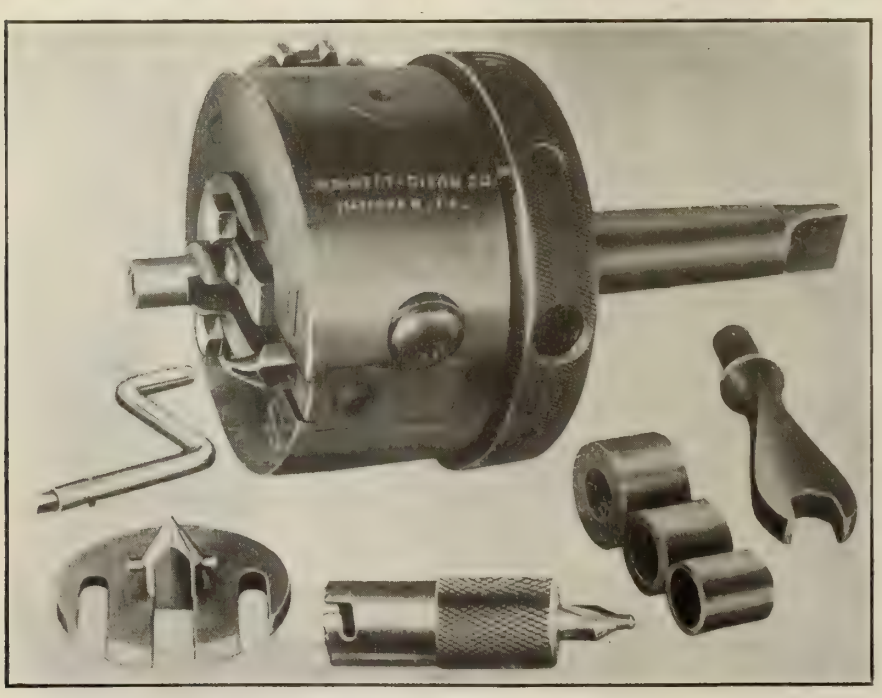
The operation of the tool is simple, the feed being effected by gripping the knurled ring with the hand and holding it, or a pin may be inserted in one of the holes in the ring and left to bear against the frame of the drill press. This operates the feed screw which moves the tool across the work, doing it at the same speed as a lathe would do it. On the bottom face plate provision is made for attaching a pilot which enters the hole in the boss to be faced and steadies the tool. On this pilot, thimbles can be placed to fit any sized hole.

There is also a drill pilot, this being used where there is no hole. It is only necessary to put the drill pilot attachment on the tool, place it on the work and start it. The drill will make the centre hole and keep same in position while the facing is being done. This makes a quick operation. When this tool is used on a milling machine or boring mill with a rigid spindle, it is not necessary to use either pilot. The tool is fitted with a Morse tapered shank and fits any drill press spindle. It is furnished with either No. 3, No. 4, or No. 5 shank.

The Mummert-Dixon Co., Hanover, Pa., are the manufacturers of this apparatus.



HEAVY DUTY ELECTRICAL REAMER.



AUTOMATIC FACING TOOL.

## HEAVY-DUTY ELECTRICAL REAMER.

THE description and illustration refer to a recently designed reamer brought out by the Cincinnati Electrical Tool Co., Cincinnati, Ohio. It is wound for direct current only, and of the heavy-duty type, being ecpecially designed for bridge work, large shops and general construction work. It is made in three sizes, to ream holes 15-16 in., 1 1-16 in. and 1 3-16 in. respectively.

The motor is series wound, four-pole type, fully enclosed, and is air-cooled by means of a fan mounted on the armature shaft. The housing and gear case are of steel, giving special strength and insuring reliable electrical performance. The gears are made of chrome nickel steel, mounted on roller bearings, and are fully enclosed in the lower head of the reamer. They revolve in grease and are separated from the motor housing by means of a plate, thereby preventing oil and grease from getting into the windings.

High-grade annular bearings are used on both ends of the armature shaft, and the spindle thrust is taken up by means of a thrust ball bearing. The switch is of special design, of the quick make-and-break type, with release lever in one side handle. It is simple in construction and guaranteed against overload.

The brush-holders are mounted on fibre blocks and are highly insulated. The binding posts which hold the leads are designed so as to secure contact by means of compression spring, doing away entirely with the use of nuts and screws. The brushes are readily accessible by means of four removable window guards and can be replaced instantly, without removing the cap or disturbing any part of the machine.

The reamer is equipped with special type slip socket, which does away entirely with the drift-key and drift-holes in the spindle.

You cannot judge a system by the number of forms that are in use.

## OUR IMPROMPTU SHELL INDUSTRY.

EACH succeeding week since the opening of 1915 has marked the gradual extension of our impromptu shell industry both in the number of plants filling contracts and in the disposition to duplicate and add to the latter feature. Those responsible for the administration of the various concerns, large and small, now employed in shell production, are not hesitating to meet the new and unique situation which has arisen and are providing the most modern machine tool equipment available, in order to prosecute the work satisfactorily, expeditiously and profitably.

It has been realized that the war in which we are engaged is not going to be over either soon or suddenly, and that, its being after all the meantime paramount consideration, we might as well begin to manufacture and export for German consumption just such commodities as first quality shrapnel shells. "Made in Canada but operative against Germany" should be expression of our earnest desire in every phase of this shell business right up to the last and perhaps least exacting requirement.

Canadian manufactured boots, blankets, etc., have been criticized, rightly or wrongly; on this however we are opinionless, these being beyond our province to discuss at this writing. Either of course contribute, if shoddy, to kill, although unfortunately, those affected would be our own kith and kin; but let us make no mistake in this shell business. The shells are being made to kill Germans, and let our mechanics see to it in addition to their workmanship being far removed from criticism, that they do not fail in this. The latest "Made in Germany," to wit the destruction of non-combatant lives neutral and enemy is but the further degree exemplification of the murderous tactics which German commercial warfare has waged the world over, and was mistaken for business acumen. To-day we see things in their true light, thanks to this European War, and ere the last shell has been made and fired and the last drop of blood has been spilt, we will have imbibed sufficient shrapnel spirit into our business nature and make-up, as to ensure that never again will "Made in Germany" over-run this fair Dominion as it has done in days gone by.

## SHIPBUILDING BOOM DEVELOPING.

IN a recent issue we referred editorially to the shipbuilding boom as touching British yards, and pointed out that but for the lack of enterprise on the part of our prominent business men and the callousness of successive adminstrations towards the propagation of shipbuilding and marine engineering on our ocean coasts and ocean highways, we too would have been participants to our pleasure and profit.

Advices now to hand from the United States indicate that there too a shipbuilding boom has not only developed but is growing in intensity, more particularly of course as far as ocean coast and ocean waterway plants are concerned but, even in this connection, the authoritative statement is made that such conditions as are now in evidence affect favorably every State in the Union. In less than two months practically all of the United States coast yards have gradually filled up with orders, a circumstance which goes to show that the demand for both ocean and coastwise craft is in no way locational, either continental or national. American lake shipyards are not of course sharing in the revival any more than are those of our own, the work of both being largely confined to repairs and overhauling for the ensuing navigation season.

A few years ago, when the Canadian Navy fever was at its height, and when the clamor for a home-built product seemed like materializing, quite a few shipbuilding incorporations were recorded as the intitial step towards establishment of the various plants. With the exception, however, of that of Canadian Vickers at Montreal, all of them appear to have been still-born.

The capital outlay for almost any class of shipbuilding and marine engineering plant runs to a substantial amount and rarely if ever gives promise of quick investment returns, a circumstance that perhaps more than anything else has weighed with Canadian capitalists who had considered embarking in such an enterprise.

More institutions of the Canadian Vickers' nature are a requirement, if we would develop broadly and deeply, and strengthen our industrial foundations, and to bring this about mere enterprise promotions must be altogether eliminated.

# The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

**Montreal, Que., Feb. 21, 1915.**—The situation in the iron and steel trade may be termed very quiet, indeed, only a small amount of business passing. In the United States, however, a decidedly better tone prevails, and in many lines unusual activity is being experienced, due largely to war orders received from the allies. That these conditions will be reflected here we have every reason to believe. More inquiries are being received, which indicates that conditions are about to improve, although it must be admitted that these inquiries have not so far led up to much business. Metals have been less active during the week, but prices manifest a tendency to stiffen.

**The Steel Market.**

Little business has passed during the week, but in a good many instances merchant bar iron has gone up in price, due to the new tariff. In structural shapes a similar increase in price has been made. Tool steel also has gone up in price. This will have a tendency to depress business for a while. However, in the steel business an early improvement is anticipated.

**Pig Iron.**

Throughout the province the demand for pig iron is very light indeed, and the new prices will tend to make it even more so. Foundries are doing very little, and until they commence operations on a

larger scale no improvement need be expected.

**Machine Tools.**

Conditions in the machine tool business undergo but slight changes from week to week, although the demand for tools used in the manufacture of shells still continues. These tools cannot, however, be had with a better delivery than three months at present. In other lines business is very dull. Machine tool supplies are moving in fairly large quantities owing to such a large number of shops being engaged in filling war orders.

**Metals.**

Copper prices seem to be stiffening somewhat, due largely to the tariff revision. Shipments of the metal to Europe still continue, there having been no curtailment due to the unsettled conditions around the British Isles. Tin has taken a jump of two cents per pound. Spelter and aluminum have also gone up in price. No special activity has been evidenced during the week, and the change in prices is due entirely to tariff factors.

---

**Toronto, Ont., Feb. 23, 1915.**—Business conditions show little change from last week when the effect of the higher tariff was just beginning to be felt. Adjustments are gradually being made, although some inconvenience is being experienced as a result of the necessary change in price schedules. All imported lines have been advanced, in most cases by an amount equivalent to the extra duty. There is also an upward tendency in the prices of Canadian-made products due to the higher cost of raw materials. Some lines have already been advanced while changes are being considered for others. The tariff revision has not as yet had, and it is doubtful if it will have, any unsettling effect on trade generally. To offset this possibility, however remote, there is every probabality of Canadian industries being stimulated, notwithstanding the increase in cost of raw materials. This will, of course, be more apparent as the trade of the country improves.

Municipalities are now calling tenders for annual supplies and some cities are proposing to proceed with more urgent work. There will, however, be considerable curtailment in civic works this year on account of the difficulty in obtaining the necessary funds. The Dominion Government's appropriations for public works throughout the country are liberal, considering the financial conditions, and they will help to relieve the unemployment situation to some extent.

There is a somewhat better feeling in the iron and steel trade, although there is not much business passing. Prices on domestic steel products have advanced. The machine tool business is quieter, but some nice orders for shell making equipments have still to be placed. There have been a number of price changes in machine shop supplies and further adjustments are anticipated. The metal markets are quiet and volume of business moving is light. Prices are keeping very firm but unchanged. The scrap metal markets are dull and prices unchanged.

**Steel Market.**

There is a little better tone in the market this week and a feeling prevails that the trade will benefit materially by the higher tariff as soon as general conditions improve. At the present time the building trade is dull and manufacturing interests are not by any means busy. The shell industry is, of course, using some steel and the volume of business for this purpose is increasing all the time. Prices on domestic steel products have advanced and quotations on bars and small shapes are now at $2.10 f.o.b. Toronto. Cold-drawn steel shafting has advanced, the discount now being 35 and 5 per cent. f.o.b. warehouse. Bolts, nuts, screws and rivets, etc., will no doubt advance, but prices are unchanged for the present.

The situation in the steel trade in the States is gradually improving and prices are firm. Galvanized steel and iron pipes have advanced $6 and $4 per ton respectively, while galvanized sheets have advanced $5 per ton, due to the exceptionally high price of spelter. Considerable uneasiness is developing as regards supplies of ferro-manganese, as it is feared that shipments of this alloy from England may be interrupted. Prices have jumped from $68 to $100 per ton, f.o.b. tidewater.

**Pig Iron.**

The market continues in a dull condition with light demand. The situation at Buffalo, N.Y., has improved. Prices have advanced in the local market owing to the tariff, and both Hamilton and Victoria brands are now being quoted at $19 per ton; representing an increase of $2.

**Machine Tools.**

There has been a lull this week in machine tool circles as regards equipments for making shells. Those concerns who have already purchased tools for this purpose and had them installed are getting their plants on a manufacturing basis. Orders for shells continue to be placed, and enquiries for tools are being received by local machinery houses. The industry is growing steadily and some further developments may be expected.

**Supplies.**

There is a better demand for machine shop supplies but the trade is in rather an unsettled condition owing to the higher tariff. On some lines all prices have been withdrawn temporarily until the necessary adjustments have been made. All imported supplies have advanced to meet the extra duty and some Canadian-made lines are higher on account of the increase in cost of raw materials. Milled screws, nuts and studs are unchanged but higher prices are expected. Tool steel may be expected to advance as prices have gone up in England, and in addition there is the extra duty to allow for. Drills and reamers are at present unchanged. Cotton wastes have advanced approximately ½c per pound on account of the duty on cotton, but wool wastes are, with one exception, unchanged. The new waste list is given in the selected market quotations. Turpentine has advanced 2c on account of the tariff, and linseed oil is up 1c a gallon. Leather belting is unchanged, but higher prices are probable.

**Metals.**

The market is quiet and there is little change in the situation. Business declined to some extent after the new duties went into effect but is gradually recovering. There have been no price changes this week but the markets are firm. The tin market is unsettled in London, due to the threatened submarine activities stopping shipments. The New York market is firm but quiet. The New York copper market is dull and unchanged; export business is easier, but the demand from brass mills continues heavy. Quotations in the local market are unchanged. The abnormal condition in the spelter market continues. Prices are still high and entirely nominal. The local market is unchanged. The lead market is firm and situation unchanged. The antimony market is quiet but very strong and indications point to higher prices. Aluminum is unchanged.

## PROPOSED RAILROAD RATE INCREASE SCHEDULE.

THE Canadian railways under jurisdiction of the Government Commission have, through the Canadian Freight Association, forwarded to Ottawa a memorandum of the increased rates for which approval will be sought. The schedule in the memorandum is as follows:

**Class Rates.**

1.—That goods carried under Canadian freight classification ratings and class rates will be advanced 2c per 100 lb., first class, and 1c per 100 lb. fifth class; rates for other classes to be figured on the usual basis, subject to standard mileage class rates as a maximum.

**Commodity Rates.**

2.—On freight traffic carried on commodity rates, the following advances are proposed:

Coal and coke, 10c per ton.

Sand, gravel and crushed stone (except stone for fluxing), 5c per ton.

Billets, pig iron, wire rods, rails, crop ends, ferro silicon, iron ore concentrates, crude oxide of iron, mill cinder.

| Present Rate. | Proposed advance. |
|---|---|
| $1.49 per ton, or lower | 5c |
| $1.50 per ton to $2.49 | 10c |
| $2.50 per ton to $3.49 | 15c |
| $3.50 per ton to $4.49 | 20c |
| $4.50 per ton to $5.49 | 25c |
| $5.50 per ton to $6.49 | 30c |

Pulpwood, cordwood, paving blocks, logs, stone, artificial stone.

| Present Rate. | Proposed advance. |
|---|---|
| 7½c or over | ¼c |
| Over | |
| 7½c but not exceeding 12½c | ½c |
| 12½c but not exceeding 17½c | ¾c |
| 71½c but not exceeding 22½c | 1c |
| 22½c but not exceeding 27½c | 1¼c |

Alum, tan bark, stone dust, cooperage stock, gypsum rock, shafts magnesite, final molasses, sale, drain tile, wire fencing, wrapping paper, cores, China clay, beer packages, charcoal nitre cake, hubs, spokes, mica scrap, pitch, sale cake, potatoes, wire netting, sulphur, in packages, cement, petroleum coke, grinding pebbles, rims, lime, lumber and forest products, rags, slag, wrapping paper, wooodpulp, articles of iron and steel manufacture, C.L.:

| Present Rate. | Proposed advance. |
|---|---|
| 15c or lower | ½c |
| Over | |
| 15c but not exceeding 25c | 1c |
| 25c but not exceeding 35c | 1½c |
| 35c but not exceeding 45c | 2c |

Wood alcohol, excelsior, petroleum, marble, tar, ale and beer, gas liquor, rice and rice flour, C.L., sludge, tin cans, glass bottles, granite, green hides, sulphur, in bulk, metal shingles and sidings:

| Present Rate. | Proposed advance. |
|---|---|
| 25c or lower | 1c |
| Over | |
| 25c but not exceeding 35c | 1½c |
| 35c but not exceeding 45c | 2c |

Grain and grain products, flaxseed and beans:

| Present Rate. | Proposed advance. |
|---|---|
| 7½c or lower | ½c |
| Over | |
| 7½c but not exceeding 12½c | 1c |
| 12½c but not exceeding 17½c | 1½c |
| 17½c | 2c |

Rates on grain and grain products from Fort William, "all rail" and "lake and rail"; also from Bay Ports to Montreal will be advanced 1c per 100 lb. Rates from Fort William and Bay Ports, and Ontario points to points in the Maritime Provinces will be advanced 1c per 100 lb., plus the difference in the present and proposed arbitraries east of Montreal.

Sewer pipe as follows, viz.:—Where present rate is 7½c or lower, 1c per 100 lb.; where present rate is over 7½c, 1½c per 100 lb.

In connection with iron and steel articles; it is proposed to advance the L.C.L. rates to the proposed 4th class rates.

Rates on binder twine from Welland Ont., will be advanced from 1c to 4c per 100 lb., to correspond with similar advances made from twine factory points in the United States.

Proposed advance in rates on canned goods:—To Montreal and Ottawa, 1½c to 2½c per 100 lb. Points in the Maritime Provinces being figured by adding established arbitraries to the Montreal rate.

Cheese.—Rates on this commodity to Montreal have been advanced 2c per 100 lb., but not higher than the 4th class rates, which basis already applies from a very large territory.

Proposed to advance the present rates on live stock from 1c to 2c per 100 lb.; also corresponding advance is proposed in the rates on live stock to Buffalo, N.Y., and United States generally.

Proposed to advance rates on dry earth paints from Argalls, Champlain, and Red Mill, Que., to the 10th class rates.

Proposed to advance rates on the following commodities to correspond with the advance made in the 5th class rates, viz., paper, starch and glucose.

It is proposed to place acids on the 7th class basis.

Some commodities such as confectionery, corn oil, cotton piece goods, stoneware, gin, lard compound, leather and soap will be advanced to classification basis.

On certain commodities such as fertilizers, ore, stone for fluxing, sugar beets, beet pulp, etc., no advance has been proposed.

The above takes care of a great majority of the changes proposed. There are a few others of less importance which have been submitted to the board in detail.

## ONTARIO BOILER INSPECTION

THE Ontario Boiler Inspection Department has decided to take over control of the inspection of all boilers in use in the province. Legislation to this effect will be introduced during the present session. This stand is taken as a part of the Government policy to prevent any further boiler accidents, and means the elimination of all "inspections" by the engineers running the boilers. At present the Factory Act requires that every boiler be inspected annually, either by an engineer employed by the boiler insurance companies or by an engineeer with five years' experience. Where a boiler is not insured the man running it has generally inspected it himself.

Under the new bill, all boilers except those used in private residences must be inspected internally and externally under operating conditions at least once each calendar year. They must not be operated in excess of the pressure determined by the regulations and stated in the certificate of inspection issued by the department. The inspections will be made by departmental inspectors, or by insurance company inspectors as heretofore, except that all reports of inspections made by the latter must be submitted to the chief boiler inspector, under whose supervision the insurance companies will work. The reports sent in by the insurance companies will be in condensed form and will be filed at the department. Under the proposed bill, there is no intention to take any business from the boiler insurance companies, the idea being to insist that all boilers are inspected by a qualified inspector which has not always been the case formerly.

# Trade Gossip

**Orillia, Ont**—The Board of Trade has elected the following officers: President, M. B. Tudhope, B.A.; vice-president, F. S. Lemis; treasurer, Nelson Ball; secretary, Harold L. Kearns.

**The Erie Pump & Equipment Co., Erie,** Pa., have appointed N. H. Brown to the position of sales engineer. Mr. Brown was until recently Chicago representative of the Bury Compressor Co.

**Sarnia, Ont.**—At a meeting of the Board of Trade the election of officers resulted as follows: President, Chester Belton; vice-president, W. J. McCormack; second vice-president, T. Grace; treasurer, R. H. Harvey; secretary, T. A. G. Gordon.

**Montreal Lodge, C. A. S. E.**—To celebrate the first anniversary of its foundation, the Montreal No. 1 Lodge, Canadian Association of Stationary Engineers, held a successful supper at the Terrapin Cafe on Feb. 19, when more than a hundred members and guests were present.

**U. S. Copper Exports.**—The Department of Commerce, Washington, announce that copper exports amounted to 7,142,042 pounds, valued at $994,520, during the week ended February 13. Of this, 5,077,497 pounds went to England; 672,107 to Italy; 448,146 to Scotland; 448,000 to Sweden; 251,969 to Norway, and 227,761 to Canada.

# INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

## Engineering

**Sarnia, Ont.**—The Loughead Machine Co., has received a contract for ten thousand shells.

**Owen Sound, Ont.**—The McQuay Tanning Co. will improve its boiler house and power plant, etc., at an estimated cost of $15,000.

**Sault Ste. Marie, Ont.**—It is announced that the Algoma Steel Corporation have received an order for rails from South Africa.

**Toronto, Ont.**—Steel & Radiation is now working on a Government order of 50,000 shells and special machinery for their manufacture has been installed in the West Toronto plant.

**Lindsay, Ont.**—The Sylvester by-law has been withdrawn by Mr. Sylvester, who claims that the council had delayed the voting. It is probable that the ratepayers will not have a chance to exercise their franchise in regard to this concern.

**Grand Forks, B.C.**—Two more furnaces of the Grand Forks smelter have been blown in by Granby Consolidated making six sections of that plant now in operation. Within another month the two idle furnaces will also have been blown in, thereby placing the entire battery of eight in commission.

**Sarnia, Ont.—The new factory of the** Sarnia Metal Products Co. has been completed, and while all the machinery has not yet been installed, orders for the manufacture of metal roofing are being put through every day. Loyd Lott, sales manager, has had complete charge of the erection of the building and the purchase and installation of the machinery and equipment.

## Electrical

**Niagara-on-the-Lake, Ont.**—The town council contemplate buying three small transformers.

**Amherstburg, Ont.**—The council are in the market for a number of street lamps and motors.

**Renfrew, Ont.**—The town have arranged for $16,845 in debentures for extending the street lighting system.

**Petrolea, Ont.**—There is a strong sentiment in Lambton county in favor of hydro-radials. A deputation representing various municipalities will visit the hydro-electric convention at Toronto on Feb. 24.

**Chatham, Ont.**—The hydro sub-station in this city will be erected by the Public Utilities Commission. All of the tenders opened recently have been rejected and the commission has decided to proceed with the work at once.

**Sarnia, Ont.**—J. J. Jeffrey, a representative of the Hydro-Electric Power Commission of Ontario, addressed a special meeting of the city council on Feb. 17. The hydro-electric question was discussed at length and much valuable information given regarding the local situation.

**ALLIES PURCHASING AGENTS.**

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**British—Col. A. G. Barton and A. C. Billing, Ritz Carlton Hotel, Montreal.**

**French—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.**

**Russian — Messrs. S. Ruperti and Aiekieff, care Military Attache, Russian Embassy, Washington, D.C.**

**Winnipeg, Man.**—No capital expenditures will be made this year by the light and power department on the second transmission line to the city power plant at Point du Bois, according to the plans now before the authorities. The establishment of synchronous condensers has eliminated the immediate necessity in that connection.

**Windsor, Ont.** — Sandwich Town Council has finally agreed to authorize the Ontario Hydro Commission to proceed with surveys and complete as soon as possible estimates for the installation of a Hydro-Electric Power system in the town. According to Engineer Jeffrey of the commission, the cost to instal a plant and wire the town will not exceed $1,200. Street lights will cost $12 a year each.

**Ridgetown, Ont.**—Engineers Jeffrey and Lawlor of the Hydro Commission met the Ridgetown town council and water and light commission last Thursday afternoon relative to the question of hydro-electric power for Ridgetown. The engineers will furnish an estimate of the cost of installing hydro here and also the expenses of operating the system.

**Toronto, Ont.**—A deputation of prominent farmers, representing Whitchurch Township, waited on the Provincial Hydro Commissioners on Feb. 17, at Toronto, requesting that a survey and estimate be prepared of a proposed new Hydro radial starting in Whitchurch and extending northerly to Georgian Bay. Chief Engineer Gaby assured the delegation that a survey would be made and submitted as soon as possible.

## Municipal

**London, Ont.**—The city council will buy 800 water meters.

**Moose Jaw, Sask.**—The city council propose purchasing a quantity of cast iron pipe.

**Sackville, N.B.**—A by-law will be submitted to raise $40,000 for water and sewerage purposes.

**North Bay, Ont.**—The by-law to raise $60,000 for road improvements was defeated by the electors on Feb. 15.

**Durham, Ont.**—The council will take over the local power plant owned by N. McIntyre and will spend $10,000 on renewals and extensions.

**Toronto, Ont.**—The Board of Control has decided not to proceed with the construction of the bridge at Moore Park which would have cost $345,000.

**Kamloops, B.C.**—The estimates of the Dominion Department of Public Works, include $29,000 for a drill hall, and $75,000 for a public building here.

**Kingston, Ont.**—The city council have requested the city engineer and his staff to hand in their resignations. It is proposed to reorganize the engineering department .

**Ottawa, Ont.**—The Board of Control has decided to ask for special legislation to spend $180,000 on the Ottawa-Prescott

20" Water Tool Grinder

# Quality Grinders

## "KEEP SHARP"

These words stamped on milling cutters apply equally to all tools. To get *results*, tools must be kept in A1 condition. How is your shop equipped in this respect?

We build tool grinders from 12" by 2" wheels up to 36" x 4". Think it over and get our catalogue to-day.

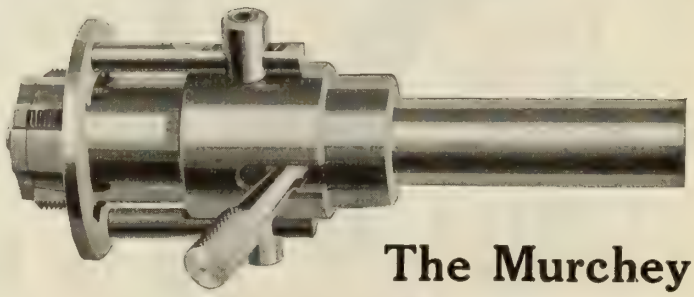
# Shrapnel Work Calls for This Collapsing Tap



## The Murchey Lever Handle Type

Made in all sizes from 1" to 12". Tripping ring is set at the point where it will come in contact with face of work when the required length of thread is made. Chasers then automatically collapse and tool is withdrawn. Expanded by lever handle and another operation started. This all counts for speed, convenience and accuracy—vital essentials on big runs of work.

## Shrapnel Manufacturers Are Finding This Out

The inquiries and the orders we are receiving prove that those concerns who are making shrapnel are quick to see the advantages of using Murchey Collapsing Taps in securing their BIG PRODUCTION at the LOWEST COST, WITH THE GREATEST CONVENIENCE and in the QUICKEST TIME. Fall in line. Use Murchey Collapsing Taps in YOUR shop, working on steel. Get the manufacturing costs of shrapnel down to the lowest figure.

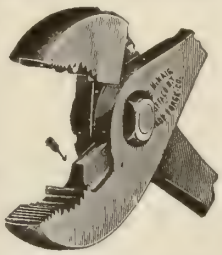
Murchey Service

is ready to show you definitely just where and how much these tools can save on your work. Ask for the New Catalog; and, better yet, send us blueprints. We can adapt our tools, by modification, to meet your particular requirements.

**Murchey Machine & Tool Co., 34 Porter St., Detroit, Michigan**

**McKaig's Combination Pliers**

**A new invention, an improvement over the old style.** When the cutters on other pliers get dull they won't cut. **"SURE CUTTERS" will cut perfectly, no matter how dull the edges get.**



When the hold gets loose on other pliers, they won't cut — but "SURE CUTTERS" do the work just the same.

**Try them**—order now, before you forget it.

**McKaig Drop Forge Company**
**Buffalo, N.Y.**

**THE HAND THAT HOLDS THE WRENCH WORKS THE SCREW**

**The "B&C" ADJUSTABLE'S NUT WRENCH**

**Operates with ease in the corners where a monkey wrench is useless.**

The standard among wrenches of this style.

All the parts are strong and durable. The operating nut is steel, and the sliding jaw a steel drop forging. All parts are carefully tempered and hardened.

**Every mechanic should have one of these great conveniences.**

highway, and in the event of the necessary legislation being secured, the ratepayers will be asked to vote upon the matter.

**Toronto, Ont.**—Tenders for the new incinerator have been opened by the Board of Control, and are as follows: Heenan & Froude, "A" $77,000; "B" $57,000; and the Canadian Griscom Russell Co., Montreal, "A" $75,000, "B" $56,000.

**Newmarket, Ont.**—The by-laws authorizing the municipality to enter into a contract with the York Radial Co. for a supply of a minimum of 500 horse-power, and to float an issue of debentures for $15,000, were both carried last Monday by large majorities.

**Transcona, Man.**—At a meeting of the town council held recently a draft bill was presented by E. Bailey Fisher, solicitor, petitioning the Provincial Government for powers to bonus industries to the extent of $100,000 or less. The bill was approved by the council, with several amendments.

**Welland, Ont.**—The fire, water and light committee has been authorized to call for tenders for the installation of a fire alarm system and report to council. Mr. McMillan, chairman of the committee, said that it was doubtful if the $5,000 voted would be sufficient. The fire alarm debenture by-law, passed by the ratepayers in January was given a third third and final reading.

**Montreal, Que.**—Hering & Fuller, engineers, of New York, have recommended to Controller Cote that the present filtration system should be supplemented by a mechanical filtration plant working in conjunction with it. The engineers reported that a plant of sufficient capacity could be installed for about $2,400,000. A plant capable of handling 15 million gallons would be necessary.

**Ottawa, Ont.**—Dr. McCullough and F. C. Dallyn, chief sanitary engineer of the Provincial Board of Health, will visit Ottawa for the purpose of looking over the plans and site of the proposed line to Lemieux Island. The Ottawa deputation was emphatically told that the Board will not approve of any Ottawa river water scheme as a permanent solution of the water problem of the Capital, and, if approved, the overland pipe scheme will be constructed for the sole purpose of removing the insurance surcharge. J. B. McRae has prepared plans for the Lemieux Island scheme, which is an alternative to the proposed pipe line to Thirty-One Mile Lake recommended by Sir Alex. Binnie and Dr. Houston.

**Victoria, B.C.**—Votes by the Dominion Government for public buildings in British Columbia include the following:—Ashcroft, public building, $25,000; Cour-

# Tenders

**Montreal, Que.**—J. E. Aldred told shareholders of the Shawinigan Co., recently that construction in connection with the subsidiary enterprise, Three Rivers Traction, would probably be started this spring and that the system would embrace six miles of track.

**Toronto, Ont.**—Tenders will be received by the chairman of the Board of Control, City Hall, up to Tuesday, April 13, 1915, for the supply of automatic valves and check valves. Specifications and tender form for the foregoing may be obtained upon application at Room 12, Purchasing and Accounting Section, of the Department of Works, City Hall.

**Windsor, Ont.**—The City of Windsor has for sale and invites tenders for the purchase of machinery and electrical apparatus, consisting of engines, boilers, heaters, steam pumps, shaft, pulleys, belts, generators, arc lamps, switchboard, quantity of copper wire, etc. Complete specifications may be obtained by application to undersigned, by whom tenders will be received up till Tuesday, March 2. M. A. Dickinson, acting clerk.

**Ottawa, Ont.**—Tenders will be received by R. C. Desrochers, secretary of the Department of Public Works, Ottawa, until March 1, for the following supplies for departmental dredging plants in Nova Scotia and New Brunswick:—Brooms and brushes, chain, hardware, hose, oils and greases, packing, paint, paint oils, etc., Manila rope, wire rope, steam pipe, valves and fittings. Specification, etc., at the offices of J. K. Blenkinsop, superintendent of dredges, St. John, N.B., and the Department of Publis Works, Ottawa.

**Hamilton, Ont.**—Sealed tenders will be received by the chairman Board of Control, City Hall, up to Monday, March 1, 1915, for the supply of the following material and equipment:—Castings (ordinary and special), iron pipe, hydrants, valves, extension boxes, hardware, lead pipe, pig lead, rubber hose, rubber boots, road oil, flux, fuel oil, coal oil, gasoline, concrete and garbage duck covers, brass brooms and sectional sweepers, brass work for water department, sewer brick. Specifications can be obtained at the office of the secretary of the Works Department. S. H. Kent, city clerk.

**St. Catharines, Ont.**—Tenders will be received by the architect until Monday, March 15, 1915, for all trades required for the erection and completion of a new Collegiate Institute to be erected in St. Catharines, Ont. A complete set of plans and specifications may be seen at any reasonable time at the office of the architect, 46 Queen street, St. Catharines, Ont. Contractors wishing to obtain

a set of plans and specifications for estimating may do so upon application to the architect and depositing with him in marked cheque for $25.00. A. E. Nicholson, O.A.A., architect, St. Catharines, Ont.

## Trade Gossip

**Nicholson File Co.**—We are advised by the Nicholson File Co., Port Hope, Ont., that the statement appearing in their advertisement of our Feb. 11 issue —"A $60,000,000 output yearly makes them economical," should read instead, "A 60,000,000 output yearly, etc."

**Vancouver, B.C.**—The British Columbia mills announce that through the C. P. R. and Government purchasing agents the United Kingdom has placed an order for 3,000,000 feet of railway ties and bridge timbers, the order to be filled in thirty days. Nine mills are handling the order.

**Woodstock, Ont.**—The Board of Trade has elected the following officers: President, W. T. Taylor; vice-president, W. D. Hobson; council, J. E. Fidler, J. A. McKenzie, T. W. Gray, W. S. West, E. W. Nesbitt, A. W. Muir, P. S. Connolly, J. G. McBeth, Col. White, A. W. Moore, I. B. Terryberry and C. I. Stewart.

**Brantford, Ont.**—The industrial condition is picking up here. The Brantford Cordage Co. have started overtime. The Massey-Harris Co. is now employing 600 men. The Waterous Engine Works state that conditions were approaching normal. The Verity Plow Works is now running ten hours daily in place of nine.

**Saskatoon, Sask.**—At the annual meeting of the Board of Trade held on Feb. 10, the following officers were elected: President, Malcolm Isbister; vice-president, J. H. Holmes; treasurer, A. F. Lenon; council, E. W. Duval, J. C. Bell, C. T. Woodside, S. W. Johns, Alan Sproatt, S. S. Stearns, George Sillers, J. D. Gunn, C. L. Tanner, W. P. Kirkpatrick, S. E. Fawcett and W. A. Coulthard.

**Nickel Commission.**—The Ontario Government announce through the Hon. G. Howard Ferguson, Minister of Lands, Forests and Mines, that a commission would be appointed to investigate the nickel situation in the province. The Government's decision came in the form of a statement dealing fully with the suggestions that nickel can be refined in Ontario. The names of the commissioners to consider the nickel problem have not been made public.

**Lethbridge, Alta.**—The Board of Trade has elected the following officers: President, G. R. Marnoch; vice-president, R.

W. Green, G. A. Wilson, Dr. C. F. P. Conybeare, K.C. W. M. Harris, J. C. Reid, H. J. H. Skeith, S. S. Dunham.

**British Manufacturing Exhibition.** — An exhibition of British manufactures is to be held at the Agricultural Hall, London, England, from May 10 to May 24 next, with the approval of the Imperial Board of Trade. The exhibition will comprise toys, fancy goods, earthenware goods, glassware, cutlery, electro-plate, clocks, common jewelry, paper and stationery. Buyers leaving Canada for the United Kingdom in time to see the exhibition, should communicate with C. Hamilton Wickes, British Trade Commissioner to Canada. 3 Beaver Hall square, Montreal.

**Northern Ontario Power.**—The annual report of the Northern Ontario Light & Power Co., which operates power plants on the Montreal River and the Matabitchouan, and which supplies light and power to the Cobalt mining district, shows gross earnings in 1914 of $875,195, an increase of $2,685, or 3 per cent. over 1913. Operating expenses were $211,023, a decrease of $3,079, or 1.4 per cent., leaving net of $664,172, an increase of $5,764, or 9 per cent. Bond interest took $273,360, leaving net surplus of $390,812, an increase of $4,667, or 1.2 per cent. more than in the previous year. After preferred dividend of $142,758, a surplus of $248,054 remained, an increase of $4,667, or 1.9 per cent. more than in 1913.

**Dominion Steel Corporation.**—J. H. Plummer, president of the Dominion Steel Corporation, states that the company is selling its entire output of steel billets in Great Britain, which is an active buyer. Mr. Plummer says the report that the Corporation is now operating its plant almost to capacity is not correct. The three blast furnaces and the open hearth plant are being operated, the company actually operating on a ratio of about 55 per cent. of its capacity. Prices for steel products have improved somewhat of late, but the advances are not sufficient to make up for the rise in freight rates, which are several times those obtaining in normal times owing to the difficulty of obtaining bottoms.

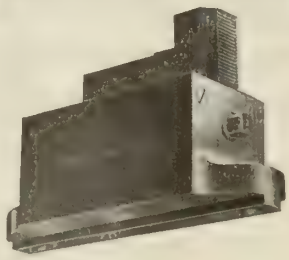
## Skinner Reversible Face Plate Jaws



For the Extra Heavy Job

Iron or Steel Body

Use Them on Large Lathes and Boring Mills

Furnished with two parallel ribs if desired.

Everything in the line of Chucks. Write for illustrated catalog.

## THE SKINNER CHUCK COMPANY
FACTORY and MAIN OFFICE New Britain, Conn.

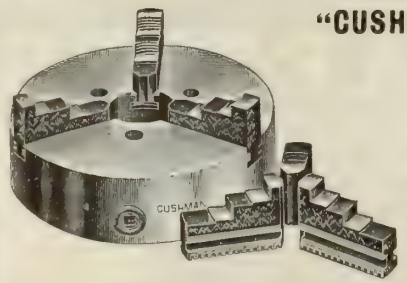
## The Garvin Machine Co.
**Manufacturers of**

Milling Machines; Profiling Machines; Cam Cutting Machines; Screw Machines; Monitor Lathes; Die Slotting Machines; Screw Slotters; Tapping Machines; Duplex Horizontal Drills; Gang Drill Presses; Four-Head Right-Angle Drills; Wrenchless Chucks; Spring Coilers; Cutter Grinding Machines; Surface Grinders; Hole Grinders; Hand Lathes and Special Machinery.

**We Want All To Have Our Catalog—Send For It To-day.**

**Spring and Varick Streets, NEW YORK CITY**

## "CUSHMAN" CHUCKS



are generally known as the "heavy pattern," being designed for hard service.

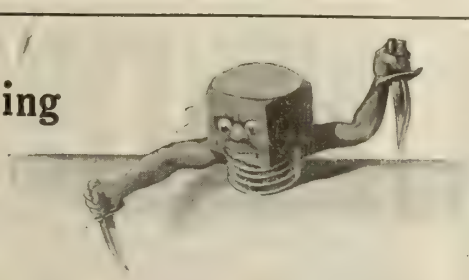
Their accuracy and reliability have been proven over and over again, and the name "Cushman" on your chuck is a guarantee of satisfaction.

Our line consists of many styles and sizes of Lathe Chucks, Drill Chucks, Centering Chucks, and Face-Plate Jaws.

**Catalogue Free.**

**THE CUSHMAN CHUCK CO.**
Hartford, Established 1862 Conn., U.S.A.

## Projecting Screw Heads



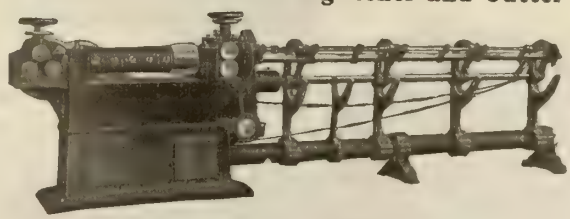
### Are Whirling Dervishes of Death

Invisible till they get you. They are fatal to the extent of over 1,500 persons killed or maimed each year in the United States. No heads are needed with "Allen" Safety Set Screws.

**Write for Circular No. 8.**

**Allen Mfg. Co., Inc., St. Johns, P.Q., Canada**

## Automatic Wire Straightener and Cutter



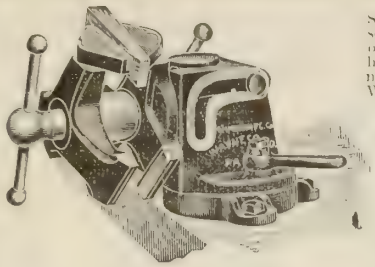
**PUT IT TO WORK**

cutting up those coils of wire, and let it earn its cost. Every length will be an exact duplicate of the preceding one, and all will be absolutely straight.

Costs little to run, because it requires little attention beyond placing the coils of wire.

Catalogue gives full information.

**The F. B. SHUSTER COMPANY, New Haven, Conn.**
Formerly John Adt & Son. Established 1866.
Also makers of Riveting Machines, Sprue Cutters, Foot Presses, etc.
Canadian Agents: A. R. Williams Machinery Co., Toronto.



Some call it the "Acrobat"; some "The Iron Hand," while others designate it "The Inhuman Human Hand," but we name it "The Emmert Metal Workers' and Machinists' Universal Vise." No matter by what name you know it the service is always there — the greatest time-saver and convenience ever offered to the worker in iron. Fifty thousand satisfied users say so. Try one.

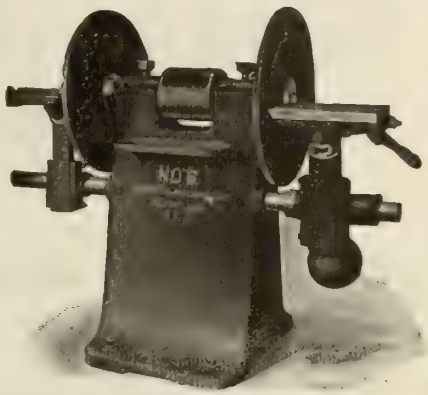
**Canadian Machinery**

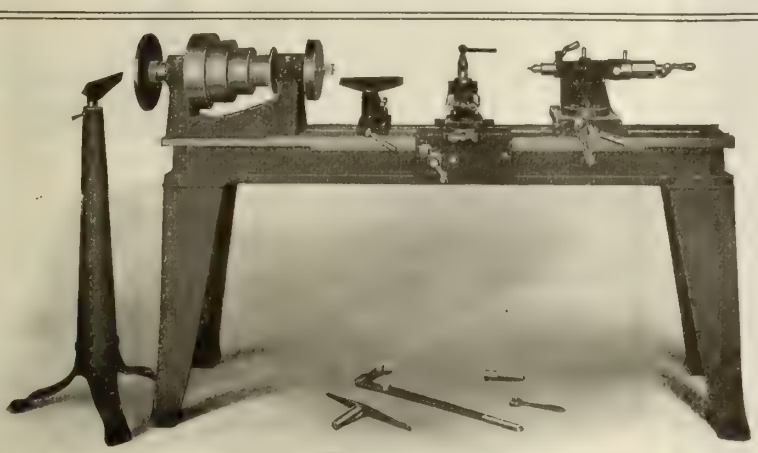
¶ This inquiry resulted in an order, the profit on which will pay for the advertisement for two years.

## Gardner Disc Grinder

Gardner Disc Grinders are made in all sizes, types and combinations. We can successfully meet any disc grinding problem in existence. Largest builders of Disc Grinding machinery in the world.



**Gardner Machine Co.**
The Disc Grinding Authorities
BELOIT, WIS.
Canadian Agents: A. R. Williams Machinery Co.



## Patternmakers' Lathe

**(16 inch Swing, 6 ft. Bed)**

Equipped with a hand carriage having rack and pinion feed in addition to regular hand rest.

The **Spindle** is of high carbon steel and runs in **self-oiling bronze bearings.** Outer end of spindle is threaded for face plate to turn work of a large diameter.

**Tail** stock has graduated swivel base. The base has set-over slide operated by a ball handle, so that same may be fed crossway of the bed, a feature very desirable for boring or turning.

HAS NO EQUAL WHERE EFFICIENCY AND ECONOMY ARE REQUIRED.

May we send full details?

**J. G. BLOUNT COMPANY**
**EVERETT, MASS, U.S.A.**

## WANTED—A Position in Your Factory

Thoroughly experienced in Best Machine Shop practice.

**Accurate, Rapid, Practical, Economical**

Can duplicate finished threads as rapidly as the operator can start the work in.

Have had wide experience threading gas fixtures, drop forgings, brass castings, connecting rods, automobile parts, electric supplies, spark plugs, set screws, etc.

**Best of references given.**

## The Wilt Twist Drill Co. of Canada, Limited

4. Concentrates entirely on the manufacture of drills, reamers, and kindred articles.

5. Employs men with years of drill making experience acquired in the largest drill factories in the world.

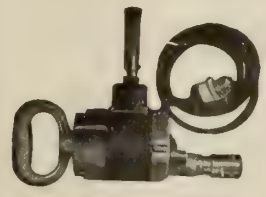
6. Uses the best steel that money can buy —steel made especially for drills.

**Result: Drills with great durability and penetrating power.**

**The Wilt Twist Drill Co.**
of Canada, Limited
WALKERVILLE ONTARIO

## U. S. Electric Drills and Grinders

**Save Time, Labor and Money**

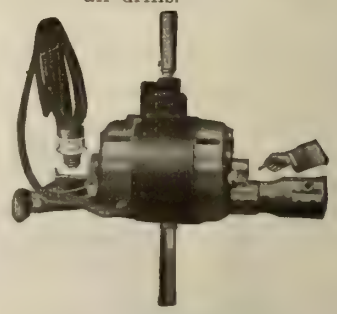


They can be attached to any lamp socket.

For drilling in metal they are superior to any other kind of portable drill. Cost 50% less to run than air drills.

2 SIZES.
3-16 inch, W.G.T., 6 lbs.
¼ inch, W.G.T. 9 lbs.
⅜ inch, W.G.T. 12 lbs.

All motors wound for 110 or 220 volts. Direct or alternating current.
Try a few of our Electric Drills and Grinders and you'll send us an order for more. Our guarantee protects you.



½ inch—2 SPEED.
Speed, 400-750 R.P.M.

For Sale By
**The Canadian Fairbanks-Morse Co., Limited**
Montreal, St. John, N.B., Toronto, Winnipeg, Calgary, Vancouver.

**THE UNITED STATES ELECTRICAL TOOL CO.**

## 16 in. Lever POST DRILL

**A Giant Little Machine For Light Drilling.**

**Will drill up to ⅞ inch.**

The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

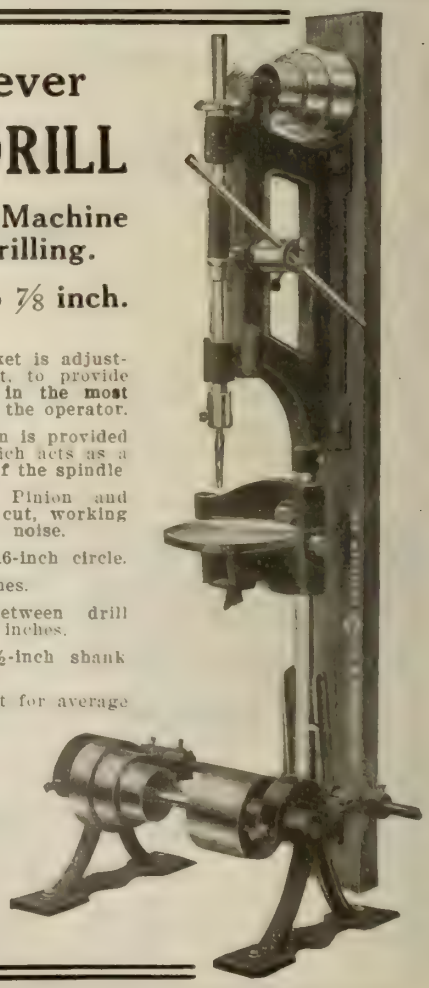
Drills to centre of 16-inch circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½-inch shank twist drills.

Speed of countershaft for average work, 300 per minute.



**A. B. Jardine & Co.**
Hespeler, Ontario

# The Mastery of Cleveland Twist Drills

is best expressed in the fact that they produce more holes per drill than any other drill made.

Conspicuous in hole production—they make holes quickly, in large numbers, with minimum grinding.

**Read about hole makers in "Drill Chips."**

**If you are not getting it each month, may we send it?**

# Not a Wasted Motion on This Screw Machine

**The Operator controls all movements of the Turret and Cross Slide Tools, also the Automatic Stock Feeding Mechanism with these Two Levers.**

The chuck and stock feeding mechanisms are operated together by power, insuring quick action and relieving the operator from tugging on stock feed levers. The mechanism is tripped to operate by continuing to push the cross slide lever forward with the left hand after the finished piece is cut off. The right-hand lever serves to index and lock the turret and feed the tools to the work. The operator's hands do not leave these two levers, hence there are no false motions to add seconds to the production time per piece. But handiness of operation is only one point in favor of

# Brown & Sharpe Wire Feed Screw Machines

When considering a machine of this type an important point is often overlooked—how long it will give efficient service. Long wearing qualities are not always apparent on the surface or in the specifications. In the consideration of first cost it should be borne in mind that B. & S. Wire Feed Screw Machines offer the maximum in length of service. The materials and workmanship best suited to withstand hard usage are put in every part of the machines.

# PROFESSIONAL DIRECTORY

## INVENTORS ATTENTION

ESTAB. 25 YEARS

Before securing a Patent send at once for a

FREE

copy of our Magazine "NATIONAL PROGRESS" and our manuscription "PLAIN PRACTICAL POINTERS," which contains latest patent laws and valuable information for inventors.

FETHERSTONHAUGH & CO.,
Head Office, Suite 1519,
Royal Bank Bldg., TORONTO, CAN.
Branches throughout Canada and United States.

ESTAB. 25 YEARS

## PROTECTIVE PATENTS

**WM. MUIR & CO., Limited**
**Manchester, England.**
Machine Tool Makers.
**Specialties:** Patent Puncher Slotting Machines, Milling Machines, Boring Machines.
**Agents:** Messrs. Peacock Bros., 68 Beaver Hall Hill, Montreal.
Send for catalogue.

**JOHN STIRK & SONS, Limited**
**HALIFAX, ENG.**
MACHINE TOOLS
**Agents—The A. R. Williams Mcy. Co., Ltd.**
**Toronto, Winnipeg, Vancouver, St. John, N.B.**

## PATENT SOLICITORS

Send your work to Ottawa
Exper personal service
Free booklet on request

**LLOYD BLACKMORE & CO., LIMITED**
HOPE CHAMBERS, 63 SPARKS STREET, OTTAWA

## PATENTS PROMPTLY SECURED

In all countries. Ask for our Inventor's Adviser, which will be sent free.

**MARION & MARION, 364 University St.**
**Merchants Bank Building, corner St. Catherine St., MONTREAL, Phone Up 6471 and Washington, D.C., U.S.A.**

## MILTON HERSEY CO.

HEAT TREATMENT INVESTIGATIONS MICROPHOTOGRAPHS
Limited
171 St. James St.
MONTREAL
ANALYSIS of METALS, COAL and COKE

## PATENTS

**TRADE MARKS, DESIGNS AND COPYRIGHTS**
*ALL COUNTRIES.*
Specialists on Infringement Cases.

**H. J. S. DENNISON**
PATENT ATTORNEY AND EXPERT.
Star Building,
18 King St. West,
TORONTO

## BERTRAMS LIMITED

**Engineers**
**Sciennes, EDINBURGH**
**PAPER MILL MACHINERY**
**and**
**MACHINE TOOLS for IRON WORKERS**
**Catalogues offered to Purchasers.**

## FREDK. HOUSE & CO.

HOUSE'S JOINTING CEMENT for Steam and Gas Joints.
HOUSE'S IRON CEMENT for Castings, &c.
HOUSE'S ELASTIC CEMENT for coating Boilers.
HOUSE'S ELECTRIC CEMENT for Road Boxes.
HOUSE'S A1 ANTI-FOULING BOILER FLUID, BELT DRESSING, &c.
Send P.C. for All Information to:
**8 Parliament Street, LIVERPOOL, ENG**

## Chemical Control for { FOUNDRY CORE ROOM AND POWER PLANT

*"Chemists to the Manufacturer"*

**THE TORONTO TESTING LABORATORY, LIMITED**

**Special Rates on Contract Work.**

**160 Bay Street, Toronto**
UNEQUALLED SERVICE

**Tests on Metals, Fuels, Oils, Water, Etc.**

**A want ad. in this paper will bring replies from all parts of Canada.**

## HOOPER-FALKENAU ENGINEERING CO.

Industrial Plants Designed, Remodeled and Improved, Power Plants Business Buildings

WHEN you need new equipment or supplies for your machine shop

**Consult this Directory**

¶ You'll find listed here the reliable makers of the lines you need; firms who believe in the progressiveness of present-day manufacturers and who appeal to their intelligence through their own engineering journal.

¶ Consult Canadian Machinery Buyers' Directory and you can't go wrong in your buying.

**Trucks, Lumber and Kiln.**
John Inglis Co., Toronto.
Sheldons, Ltd., Galt, Ont.
Herbert Morris Crane & Hoist Co., Ltd., Toronto.
Northern Crane Works, Walkerville.

**Trucks, Factory, Freight, Etc.**

Trimont Mfg. Co., Roxbury, Mass.

**Wrenches, Ratchet and Basin.**
Bemis & Call Hardware & Tool Co., Springfield, Mass.

# CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS--Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5.00 per line a year is charged to non-advertisers.

GANANOQUE, ONT.

# No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.
Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.
*How to use Stevens' Stopper, or Circle Cement*:
Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings, and that means the saving of your dollars.
Another thing—I do not ask a fancy price for it.
A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

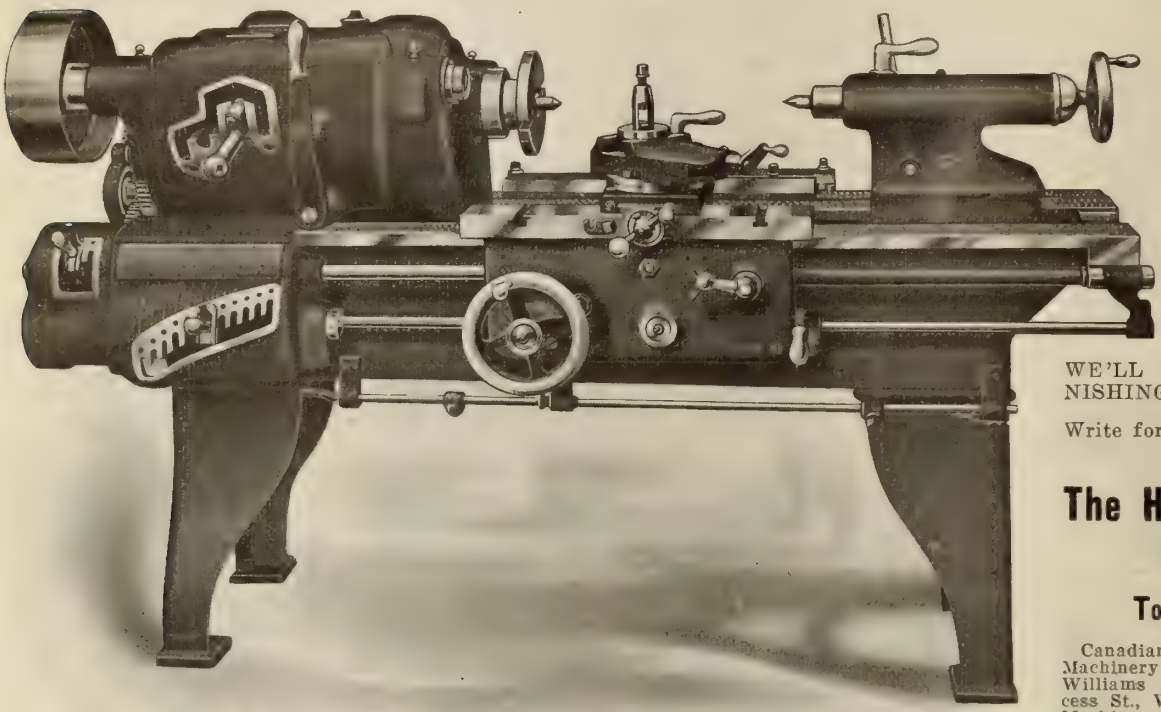
## FREDERIC B. STEVENS

Manufacturer of
Foundry Facings and Supplies, Buffing Compositions and Platers' Supplies
Corner Larned and Third Sts. DETROIT, MICH.

BRANCHES
Windsor, Ont., 20 Pitt St.
Indianapolis, Ind., 138-140 South Delaware St.

# HENDEY 18-Inch GEARED HEAD LATHE

*8 mechanical changes of speed for spindle with driving shaft running at constant speed, 4 direct and 4 through back gear*



36 DIFFERENT THREADS AND FEEDS are had through **Mounted Change Gearing**, each change being quickly made through controlling handles in Gear Boxes.

BEFORE PURCHASING A NEW LATHE INVESTIGATE THE HENDEY SERVICE.

WE'LL HELP YOU BY FURNISHING LIST OF USERS.

Write for descriptive circular.

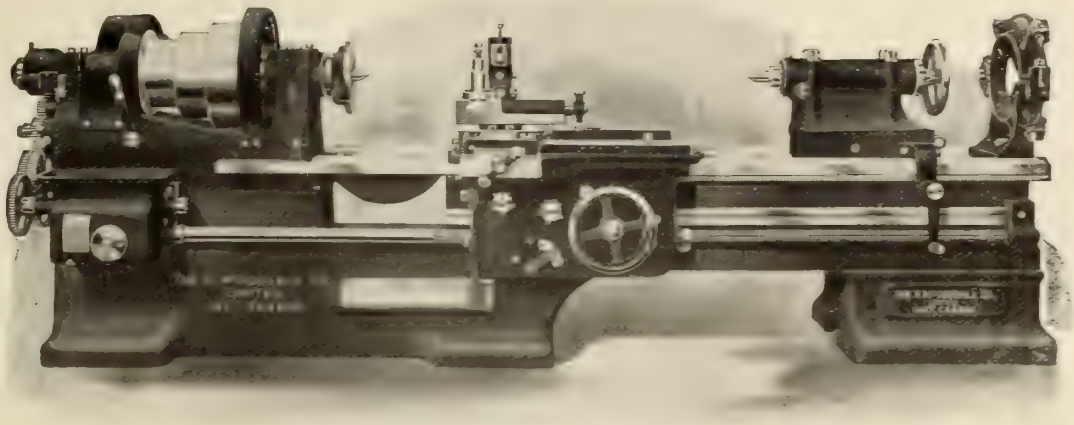
## McDougall Gap Lathes

—

Strength
Accuracy
Quality



Take a look at the next money you intend to invest in a Lathe.
Then, take a look at the money's worth we offer you in our machine.
Your money will soon come back to you in increased production and we will have the pleasure of having a satisfied user. Our machines are just as good as they look and they look good too.
We invite the closest inspection.

ARE-MAC-DEE IS A GUARANTEE

**Particulars on request.**

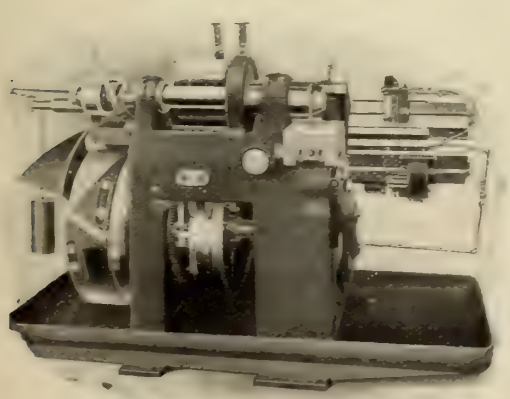
## The R. McDougall Company Limited

**Manufacturers**
**GALT, Ont., Canada**
**The Canadian Fairbanks-Morse Co., Limited, Sales Agents.**

# GRIDLEY
# Automatics

**Single and Multiple Spindle**

"GRIDLEY" Single Spindle



## A Characteristic Point

lies in the turret of these automatics. On turret lathes of other types the tools are held by shanks, making it impossible to use special tools. **In the Gridley Turret** the tools are supported close to their cutting points, eliminating overhang, spring and consequent chatter. In addition, it is very easy to set tools up tandem, cutting one behind the other.

Other distinctive features of both the Single and Multiple-Spindle Gridley machines are described in our illustrated catalog. Write for a copy now.

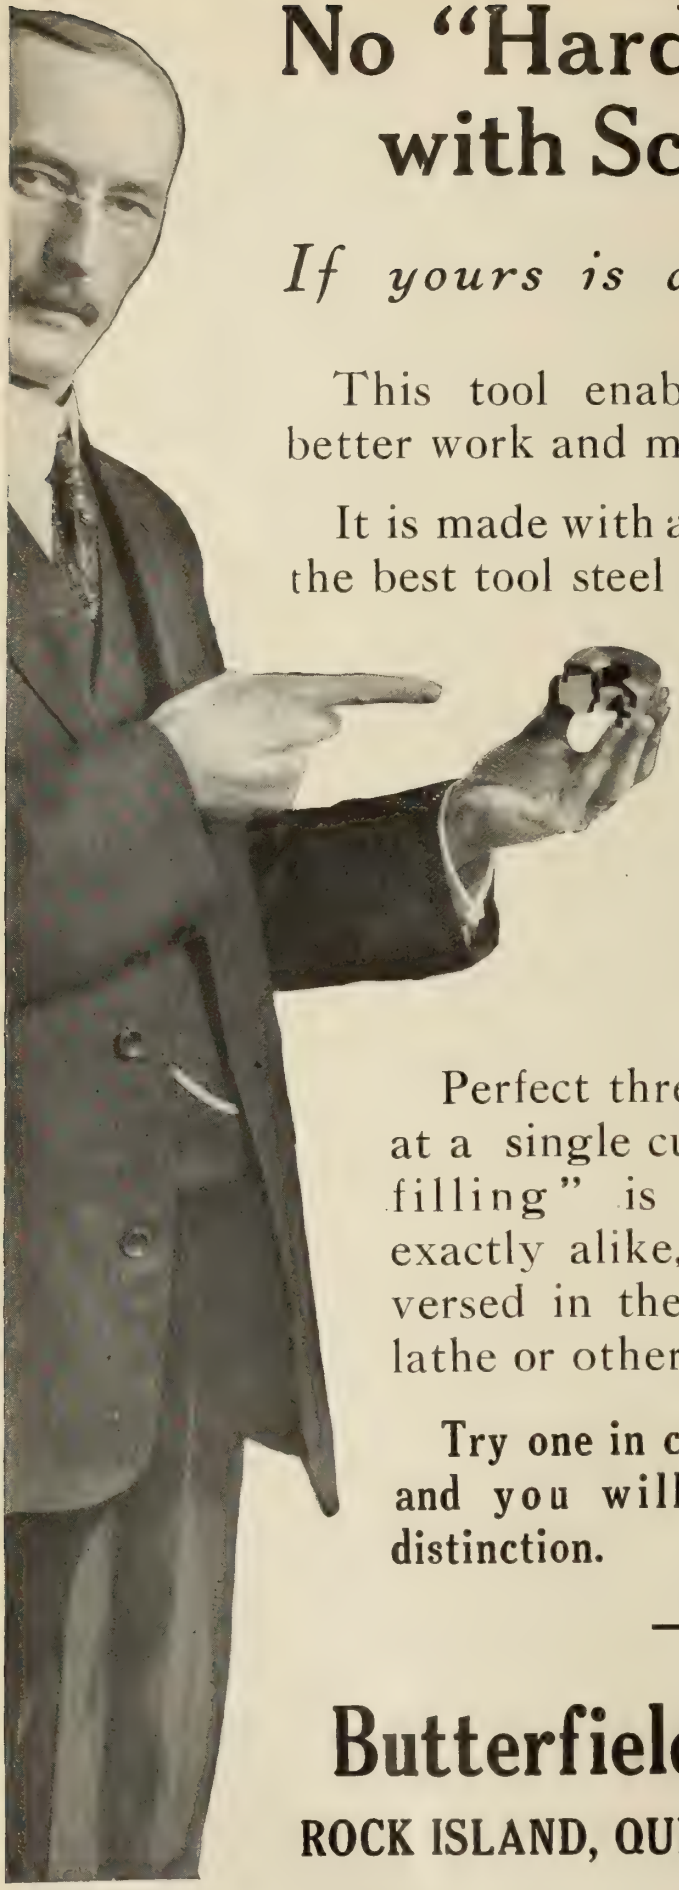
## Windsor Machine Co.

**WINDSOR, Vt., U. S. A.**

**Canadian Office, 1501 Royal Bank Building, Toronto,**
**E. C. Roelofson, Manager.**

# No "Hard Times" with Screw Plates

*If yours is a REECE tool*

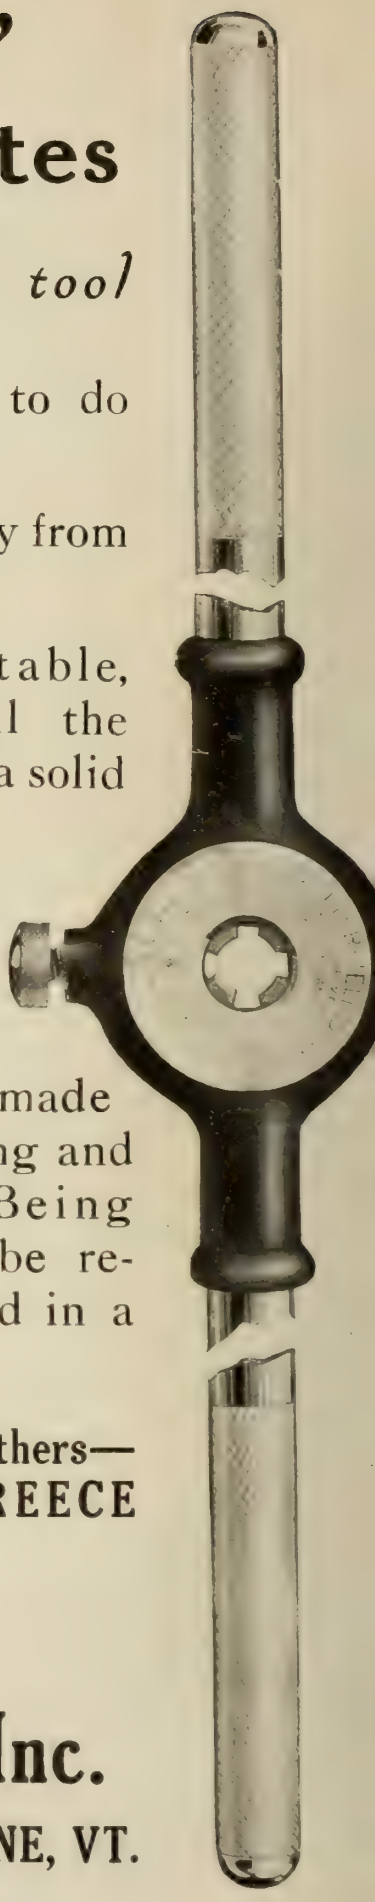


This tool enables best men to do better work and more of it.

It is made with absolute accuracy from the best tool steel procurable.

It is adjustable, but retains all the advantages of a solid die.

Dies never loosen or cut cross threads.



Perfect threads are easily made at a single cut. No "backing and filling" is necessary. Being exactly alike, the dies can be reversed in the collet and used in a lathe or other machine.

**Try one in competition with others—and you will realize the REECE distinction.**

# CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by the MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

Vol. XIII | Publication Office: Toronto, March 4, 1915 | No. 9

## Analyze Your Filing-Cost

**"FILING-COST"** is made up of **two** items. *First:* **"File-Cost"** —the cost of new Files. *Second:* **"Filing-Time"**—the Time or Labor cost. "File-Cost" is by far the smaller item. Yet a very **slight increase** in this item effects a **substantial decrease** in expensive "Filing-Time."

Mechanics who continue to use files that should have been discarded long ago, are working with tools of diminished efficiency. The use of such files demands increased time and effort—and results in decreased quantity or inferior quality of work.

The net saving to be effected by promptly replacing all such files would pay a handsome profit over the small first cost of extra files.

We strongly urge every Manufacturer to analyze his Filing-Cost. Losses, undreamed of at present, will be uncovered by a survey of this work.

Greater efficiency will be secured by standardizing your plant's file-equipment with the "Famous Five":

**KEARNEY & FOOT**
**GREAT WESTERN**
**AMERICAN**
**ARCADE**
**GLOBE**
***(Made in Canada)***

They reflect a half-century's experience in making GOOD files. Specially designed and built machinery insures their uniformly efficient service. Five great plants—with a 60,000,000 output yearly—permit the most advanced methods and equipment. Priceless data obtained in supplying 90 per cent. of Canada's file requirements, enable us to exactly meet your every file-need. Among our 4,000 different patterns are the very files YOU need for maximum efficiency in YOUR plant.

"File Filosophy" contains 48 pages of valuable information on FILES and their Proper Use. A FREE copy will be sent YOU on request.

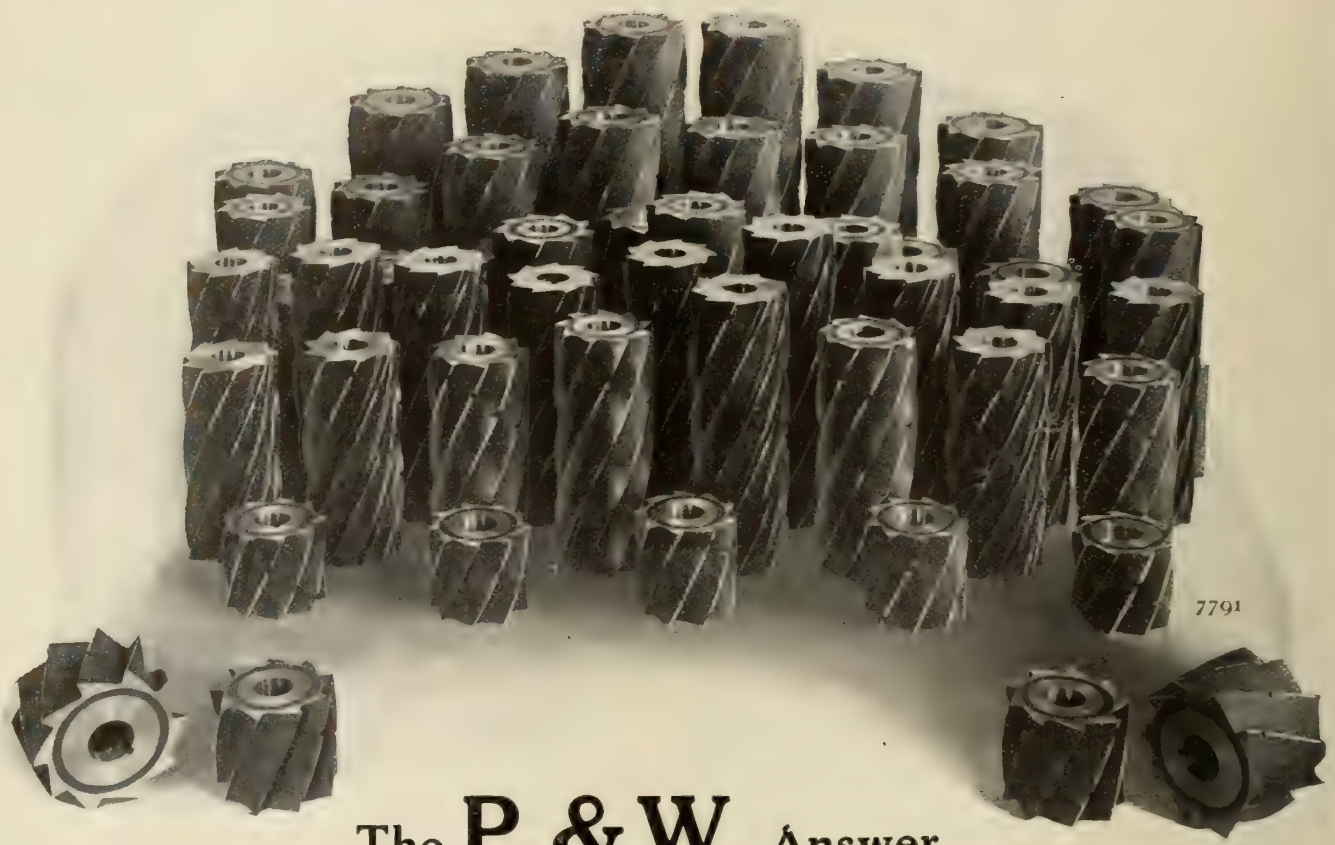
# Your Heavy Duty Cutter Problem



## The P.&W. Answer

Use

## Coarse Tooth, High-Speed Milling Cutters

We are prepared to furnish promptly coarse tooth milling cutters of High-Speed Steel adapted primarily to the heavier class of milling.

**Long Life**

Such cutters have the advantage of long life as the large teeth permit of more grindings. It will also be seen that less time is required to sharpen.

**Increased Production**

The ample chip room insures a remarkably free cutting action and will increase production by a high percentage with less power required to drive.

**Strong Teeth**

The teeth being larger are exceptionally strong and will easily stand the heaviest feeds without breaking.

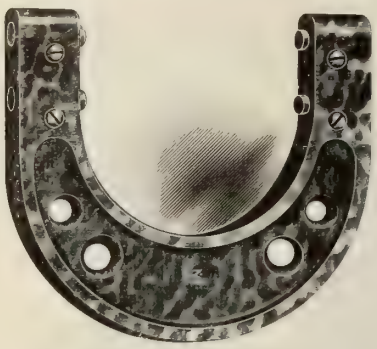
# Cylindrical Limit Gages

## For Shells and Shrapnel



### Crescent Gage

This gage is peculiarly adapted to the accurate measuring of outside diameters of Shells and Shrapnel as well as other cylindrical work.

The upper points are set to the maximum limit—the lower points to the minimum limit. These can be sealed to prevent tampering.

### One gage does the work of two

with all the consequent saving of time and labor.

Points are of tool steel, hardened and ground.

**We are also prepared to quote prices on special gages for Shell Work. Write us about your requirements.**

# Buy Roofing as You Buy Your Life Insurance

A HUNDRED and one roofing manufacturers ask for your patronage. Each backs his claims with arguments that seem convincing. It's confusing, to say the least. And the loss is yours if you select unwisely.

There is only one absolutely safe course to follow. Buy roofing as you buy your life insurance.

Just as you consider the insurance company first and the policy second—because you realize that the policy is simply a promise to perform and the standing of the company your actual security — so you should consider the roofing manufacturer first and the roofing itself second.

# J-M ASBESTOS ROOFING

"THE ROLL OF HONOR"

We tell you that this roofing is made from asbestos rock—that it is practically imperishable—that it is unaffected by heat or cold, rain or sleet—that it affords excellent fire protection—in short, that it will give you absolutely satisfactory and lasting service without any painting, coating or attention whatever.

But, more than this, we remind you that behind this "promise to perform" is the security that lies in buying your roofing from a company with a country-wide organization built up by a policy that does not willingly permit a single customer to be dissatisfied.

J-M Asbestos Roofing promises to give you the utmost in roofing satisfaction.

The Johns-Manville organization, with its branches everywhere, sees to it that that promise is invariably made good.

J-M Roofings—because of their variety—are adaptable to every type of building.

**J-M Asbestos Built-Up Roofing**—Made of exactly the same materials as J-M Asbestos Ready Roofing, but built up on the roof of alternate layers of pure Asbestos fabric cemented together with Trinidad Lake Asphalt, instead of being laid in single sheets. Particularly serviceable for flat roofs.

**J-M Regal Roofing**—Of Its Type the Best by Test—For those who prefer the rubber type of wool-felt roofing. Certain to give absolute satisfaction because of the "quality-policy" and Johns-Manville organization service back of every J-M product.

THE Lo-swing LATHE

# Apprentice System at Lynn Works of General Electric Co.*

By Theodore Bodde

*The advantages accruing from the employment of specially trained men is generally recognized by at least the larger manufacturing and other corporations, and to secure and maintain the necessary quota of such employees, an apprenticeship course forms part of the works organization. Last week we featured the scheme of a Canadian railroad motive power department, and in the present instance that of a mammoth U.S. Corporation is outlined.*

IN a large factory building belonging to the General Electric Co., at West Lynn, Massachusetts, there exists a unique school of practical electrical and general technical knowledge; unique, because it combines and mingles intimately the practical factory atmosphere with the theoretical ether of science.

This educational institution gives practical instruction through factory work and theoretical knowledge through class room lectures. The class room work is so arranged as to occupy slightly less time in years than the practical work. If a student therefore fails to pass in one of the classes and is obliged to repeat it, he can finish all classroom work within the prescribed time limit of apprenticeship. The institution provides for young men with no more than a grammar school education as well as for high school graduates. The grammar school graduates are placed in the so-called apprentice school, while the high school graduates enter the engineering school. They are selected out of a large number of applicants.

### System Outline.

In the apprentice school, the young men are developed into efficient skilled workmen, assistant foremen and foremen, and tool designers. In the engineering school they are converted into efficient practical engineers. The classroom work of the apprentice school stretches out over a period of nine terms of 14 weeks each. That of the engineering school covers a period of seven terms of 14 weeks each. There are three terms in each school year. The teaching staff consists of six instructors and one superintendent.

The foregoing outlines in a general way the system of this technical school and we will now consider some of the different principles and methods which are followed in the electrical department, in order to give a general idea of the system. To the apprentices one term of electricity is given, while to the students of the engineering school five terms of electricity are allowed.

### Principle of Concrete Representation.

The first principle followed, for the purpose of effectually impressing the mind of the young man, is that of concrete representation of the different truths which are taught him. The reason for this lies in the fact that these young men have generally left school at an early age. Consequently, theory and its demands on the imagination are almost unknown to them and the imagination has not been trained to its full strength. On the other hand, having been in contact with matter and material things during the greater part of their lives, they can, with no difficulty whatever, see through material things and material representations, where they would be powerless were those representations only abstract ones. Therefore, it is through this concrete method of representing things that one must appeal to them.

### Technical Education Defined.

Technical education consists in impressing on the mind the relations between natural phenomena; in other words, in leading the pupil to discover the links connecting different facts. In popular language this discovery is expressed by the saying: "I see," which means nothing else than "I see the link; I understand;" for when we see a thing we understand it. Now if this connecting link can be made visible by means of really visible things, instead of by things which are only visible through an effort of the imagination, we shall be able to make all things understandable to those whose imagination is not strong enough for that effort, and technical education for the masses will become possible.

It is true that education consists also in training that very effort of the imagination which is needed for the concentration of the mind. It is this branch of education which produces thinkers. It produces, however, perfect fruit only when applied to the very few who have a natural aptitude for thinking. The large mass take up only facts and relations and become effective tools, but very few among them become thinkers and leaders. In our present civilization it is well that this should be so. At the same time we may long for some future in the advancing ages when this condition will no longer be necessary, and everybody will be trained for the beauty and development of himself and of the race.

At present, the world needs many tools for its material growth, and the General Electric Co., which, is itself a small world, daily feels the need for efficient tools, and all efforts are exerted in this direction. If, now and then, thinkers are mixed among the tools, they will be recognized sooner or later, and will step out of the mass through their own efforts. Hence, for the present, the methods of education should not be molded for them but for the large masses. Neither should the methods of education be molded for the other extreme, the dummy. In the General Electric Co. apprentice and engineering school, the dummies are eliminated while passing from the lower classes to the higher ones, and this is done by a simple weeding out process, through keeping a close observation and a just record of their doings and progress throughout each term. An educational committee meets every week and carefully eliminates the chaff from the wheat, the result being that the higher classes are very nearly perfect. The following are some examples of the concrete representation of things as applied in the electrical engineering department of this school:—

### First Term.

Throughout the first term, the text book of W. H. Timbie, "Essentials of Electricity," is used. The beginners have special trouble in grasping the idea of line drop in transmission lines and other similar very real and important phenomena in power transmission. The reason is obvious. Transmission lines are so large that they have never been grasped in their entirety in the imagination of the student; they are too long to be contained in the narrow space of his vision.

In order to overcome this difficulty, a miniature transmission line was made, reproducing in every way the phenomena of a large power transmission. The lines are made of thin resistance wire and are stretched across the whole length of two blackboards which run along the wall of the classroom. A set of incandescent lamps at about the middle of the line produces one load, and another set of lamps at the end of the line produces another load. The beginnings of the wires are switched to two

*From General Electric Review.

binding posts, between which are 275 volts d.c.

By varying the number of lamps, different loads are put on the line at different points, thus producing different currents and different line drops in the sections of the line. These values are measured in a direct way by the students. This gives them practice in the manipulation of d.c. voltmeters and ammeters. The readings are then written down in chalk directly over the corresponding sections on the blackboard. From these results, calculations are made relating to power loss in the different sections of the line, voltage on the loads, power delivered to the loads, total power transmitted, etc. All these calculations, written down again on the blackboard over the corresponding part, are then finally checked up by means of direct measurements.

### Getting Results.

The three-wire balanced and unbalanced systems are also reproduced in miniature by the same means, and the general run—first measurements, then calculations, and at last checking up by other measurements—is essentially the same as before. It is remarkable what good results this method of teaching has produced.

In a latter part of the term the d.c. generator and motor phenomena are illustrated by means of an old fashioned bipolar shunt wound dynamo which has been fixed for the purpose and provided with a flywheel. This makes possible the illustration of the counter-electromotive force which exists in a running motor.

Suppose the dynamo has been connected up at the end of the above described miniature transmission line, and runs as a motor. A set of lamps on the same transmission line shows its bright lights as a result of the power which it takes from the same source. If now the double-pole switch between the binding post and the transmission lines is suddenly opened, the motor, because of the inertia of its flywheel, will become a generator, and the lamps will still show their bright lights, this time, however, taking their power from the dynamo side; for the current on that side is reversed, as is clearly shown by means of an ammeter. The voltage on the line can be measured at the instant that the double-pole switch is opened, which serves to illustrate in a clear and real way the counter-electromotive force which existed an instant before while the dynamo was still running as a motor.

Thus the student becomes familiar with all the secrets of the dynamo. Even this counter-electromotive force, so often the stumbling block to beginners, becomes visible, almost palpable to them, and impresses itself on their minds. The measurements of voltage and currents, in relation to the speeds through which the flywheel passes, are then written down, calculations are made and again experimentally verified, and it is thus that the different phenomena enter into the mind almost without effort; for the student is interested in these different operations from start to finish, and is not tired out by an undue effort of the imagination. The channels between his senses and his mind are wide open, and the knowledge enters without effort.

### Second Term.

During the second term of electricity, Swoope's textbook, "Lessons in Practical Electricity," is used. This textbook is rich in material, and in this lies its great merit, for it offers many topics to be treated and talked about in the classroom. It describes many experiments, and to follow these descriptions requires a certain amount of the student's imagination. It is to be noticed again that the student of the engineering school is a high school graduate and has had his imagination trained originally to a greater extent than has the average aprentice. As the time is limited, considering the large scope of the book, this term is mainly devoted to theory, though here and there concrete illustrations are made if the described experiments of the book do not convey the fact clearly enough to the mind.

### Third Term.

The third term of electricity is devoted entirely to experiments and laboratory work. Large d.c. and a.c. dynamos and the necessary instruments are put into the students's hands, and under the direction of their instructor they make the usual practical tests relating to voltage, speed, load, losses and efficiency. It is surprising how quickly the students get hold of this term's work and of the right way of doing things. Their enthusiasm and interest is very visible in the neatness with which they make up their reports. Some of these are almost works of art, so carefully are the sketches drawn and the curves traced.

After this term of heavy practical work, the student goes back again to pure theory. Two terms of advanced electricity along the lines of Franklin & Esty's textbook of electrical engineering now follow. During this time the student has ample occasion to verify and think theoretically over the different points and phenomena which have come up during the former term, and thus the last foundation stone of electrical knowledge is deposited in his brain.

The classroom in which the student gets these advanced courses of electrical engineering is in the laboratory, so that the whole atmosphere is impregnated with the practical developments of the great industry. Dynamos, rheostats, and all kinds of motors look at him from all sides while he ponders over some intricate problem, and like real friends suggest ideas to him. The walls carry charts illustrating such useful rules as the famous Fleming's three-finger rules for motor and generator directions, and the unconscious daily look at these charts produces on the student's mind a lasting impression, in the same way as in daily life the advertising poster impresses the public mind. If there is any formula, any figure, difficult yet useful to remember, there is no better and easier way of mastering it in one's memory than by posting it in some conspicuous place to which the eye is turned every day. These repeated impressions will leave their mark without requiring any acrobatic effort of the brain.

## THE ENGINEERING FOUNDATION.

ON January 27, 1915, there was held in the auditorium of the Engineering Societies Building the inaugural exercises of the Engineering Foundation, established by the United Engineering Society. The initial gift to the Foundation of $200,000, made by Ambrose Swasey, past-president of the American Society of Mechanical Engineers, was formally accepted at this time. So far as known this is the first instance of a foundation devoted to engineering purposes and this meeting constituted an appropriate tribute to the generous gift which made its inception possible and gave opportunity for expression of the satisfaction and approval which is felt by engineers everywhere at the establishment of a means for forwarding the work of the engineer along the broadest possible lines.

Gano Dunn, president of the United Engineering Society and past-president of the American Institute of Electrical Engineers, acted as presiding officer, and on the platform were seated representatives of the three societies constituting the United Engineering Society, and of the American Society of Civil Engineers. Members of the four societies and many friends interested in the profession composed the audience.

In his address, the chairman reviewed the history of the Engineering Societies Building, the purpose of the United Engineering Society, and the formation of the Engineering Foundation made possible by Mr. Swasey's gift.

Mr. Swasey very briefly expressed his appreciation of the cordial manner in which the announcement of his gift had been received. He believed that the

meeting was also evidence of the appreciation felt of what had been accomplished by the United Engineering Society and the work which they had done in planning and bringing about this Foundation. It is a very simple matter to throw a few shovelsful of coal under the boiler, he said. We must have fuel if we would have power, but to the engineers who designed the boiler and the engine, and who so proportioned them and so correlated them that the products of combustion can be used to greater advantage than ever before for the benefit of mankind, the greater credit belongs.

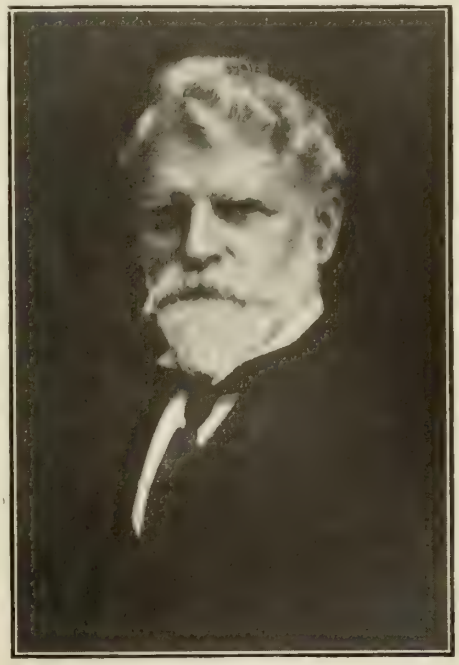
### Ambrose Swasey.

Ambrose Swasey, the donor of the initial fund for the Engineering Foundation, is widely known as a member of the firm of Warner & Swasey of Cleveland, Ohio, prominent machine tool builders and the foremost builders of telescopes in the world. Among the instruments which they have designed are the famous Lick, Yerkes, and the United States Naval Observatory telescopes, as well as the great 72-inch reflecting telescope for the Canadian Government, which is now under construction.

Mr. Swasey is known also, in addition to his engineering achievements, for his practical efforts towards scientific education and the advancement of the profession. His gift for the establishment of the Engineering Foundation is in line with these undertakings, which may be destined to outlast his fame as an engineer. Mr. Swasey gave the handsome observatory to Denison University at Granville, Ohio, and the science building for the University of Nanking and the Young Men's Christian Association College now being erected in China, were made possible through his gifts. He has also as president of the Warner & Swasey Company, interested himself earnestly in the establishment and conduct of its school of apprentices, and indeed the weight of his influence is to be found in every project tending to the development and encouragement of the human element, helping men to help themselves.

Mr. Swasey was born in Exeter, N. H., his ancestors being among the early settlers of New England, coming to American in 1638. He received his education in the 'Little Red School House' of the district, and his after life has shown that the seed sown by the old schoolmaster fell upon good ground. At the age of eighteen he entered upon the machinist's trade in Exeter, and in 1870, in company with his present partner, Worcester R. Warner, he left the granite hills of his native State to go into the employ of the Pratt & Whitney Company, at Hartford, Conn. His energy and ability soon became manifest to his new employers, and his aptness in the solution of mechanical problems was so thoroughly appreciated, that the remark, 'Send it up to Swasey,'' was a common one with them.

While in charge of the gearing department, he invented and perfected the epicycloidal milling machine for producing the true theoretical curves of the teeth of gears ,and a few years later he made another advance step in the solution of that difficult problem, inventing an entirely new process for generating and cutting spur gears, which proved a practical solution of the very important theory of the interchange system of gearing. In 1880, Mr. Swasey resigned his position with the Pratt & Whitney



AMBROSE SWASEY
Past President American Society of Mechanical Engineers and Donor of the Initial Gift to the Engineering Foundation.

Co. and, together with his present partner, established in Cleveland, O., the business which has since grown to such large proportions. Mr. Swasey's inventive and mechanical genius has emphatically manifested itself in the design and construction of the fine machine tools and astronomical instruments made by his firm.

The manufacture of meridian circles, transits and other astronomical instruments of extreme accuracy and precision has formed a large part of the firm's work, and in the designing of all these instruments Mr. Swasey has taken an important part. For graduating the fine circles of these delicate instruments it was necessary to have a circular dividing engine, and as there was no instrument in the country of sufficient accuracy, the problem was taken up of designing and perfecting such an engine which, when completed, was capable of dividing circles automatically up to 40 inches in diameter with an error less than one second of an arc, probably the most accurate circular dividing engine ever constructed.

Mr. Swasey is the inventor of a number of instruments used by the Government in its coast defense including several improvements in the construction of range finders.

Many honors have come to Mr. Swasey for his work and achievements. He is a past president of the Society, a member of the Institution of Mechanical Engineers of Great Britain and of the British Astronomical Society. He is a Fellow of the Royal Astronomical Society, is past-president of the Cleveland Engineering Society, and, in 1900, received from the French Government the decoration of the Legion of Honor for his achievements in the design and construction of astronomical instruments.

He was a member of the Jury of Awards of the Nashville, the Pan-American and the St. Louis Expositions, and vice-president of the Jury of Awards of the Jamestown Exposition. In 1905 he served as president of the Cleveland Chamber of Commerce, and the same year the degree of Doctor of Engineering was conferred upon him by Case School of Applied Science. Mr. Swasey was married October 24, 1871, to Lavina D., daughter of David and Sarah Ann (Dearborn) Marston, and he and Mrs. Swasey had traveled extensively, up to the time of Mrs. Swasey's death early in the year of 1913.

**Steam Sanding Apparatus.**—In conjunction with steam sanding apparatus, states the Railway News, a plan has been introduced wherein a valve is arranged so that superheated steam is used as long as it is available, but on failure of the supply, the ejector is automatically supplied with saturated steam. Superheated steam is supplied to a casing by one connection and saturated steam by another, which is normally closed by a piston valve moved by a spring, and by the pressure of the superheated steam on the head of the valve. The superheated steam passes through ports in the valve into a chamber, and thence, when the manually operated valve is open, through a chamber and valves into a chamber communicating with the ejector pipe. When the supply of superheated steam fails, the saturated steam automatically opens the piston valve and passes to the ejector pipe.

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## TURRET LATHE AND VERTICAL BORING MILL PRACTICE.—IV.

By Albert A. Dowd.

THE development of the gas engine in recent years has progressed to such an extent that it is adapted in its many forms to a great variety of uses. The automobiles which we see gliding along so smoothly and silently on our streets and highways would not have attained their present degree of perfection had it not been for the development of this engine. The motorcycle which dashes by us with more than the speed of a racehorse, and the aeroplane which soars overhead, would not have been possible without the power derived from this wonderful piece of mechanism. On the water we see craft of every description impelled by the same force, from the fisherman's dory to the pleasure yacht. The farmer of to-day brings his produce to the market

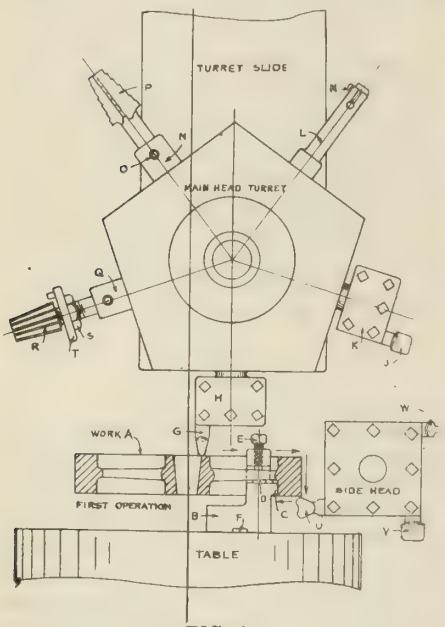

FIG. 1.

in a fraction of the time he formerly required, and is enabled to carry loads which would have been prohibitive with horse-drawn vehicles. He also uses tractors for his plowing, reaping, harvesting, etc., and a stationary engine for pumping water, cutting wood, threshing grain and many other purposes.

In nearly all of the industries the gas engine has become a prominent factor, and its development has been such that it is now so perfected that it is very nearly "fool-proof," and requires little attention to keep it in running order, so that it can be successfully used by anyone having an ordinary degree of common sense. The flywheels used on these engines are of many kinds, but they all have one point in common, viz., a heavy rim which, by its momentum, assists in keeping the output uniform. This rim must run in concentricity with the axis of the wheel, and must be carefully balanced in order to prevent vibration when running at a high rate of speed.

As there are so many types of gas engines, it is evident that the flywheels also would be of different construction, according to the class of work for which they were intended. A flywheel for a cheap farm engine may be of one type and one designed for an automobile of another, while a flywheel for a motorcycle engine shows other variations in design. Spoked wheels having a heavy rim are employed in many instances on the cheaper variety of stationary engines, such as those used for pumping or other farm work and webbed wheels, with provision for some form of clutch on their interior or exterior surfaces, are found on automobile or boat engines. The clutch surfaces may be either straight or taper, but the latter is more commonly found.

In the machining of these various types, the smaller wheels are commonly handled on some one of the many kinds of horizontal turret lathes, while the larger sizes are more economically handled on the vertical turret lathe or vertical boring mill, these being of sufficient power to take very heavy cuts, and, being of vertical construction and massive design, are not subject to the vibration apparent in the smaller machines of the horizontal type. In addition to this feature, the chucking and holding of the work is somewhat simplified, as the piece is laid down on the table, instead of being, so to speak, hung on the end of a revolving spindle. We shall consider the machining and handling of three varieties of flywheels on the vertical type of turret lathe.

### Machining a Spoked Type Farm Engine Flywheel.

The work A shown in Figure 1 is a farm engine flywheel of the spoked type which is to be machined in two settings, the first of which is shown in the illustration, with a tooling diagram which shows the tools required for the work and their position and sequence of operations.

The method of holding the work is somewhat out of the ordinary, in that a set of special jaws B is used, which centre the work from the inside of the rim by means of the offset C in the jaws. The jaws are keyed to the sub-jaws in the table at F, and are provided with a set of steel buttons or plugs D on which the spokes of the flywheel rest. A slot is provided large enough to give plenty of chance for variations in the casting, and the set screws E are brought down tightly on the spokes, so that they serve to eliminate vibration and also act as drivers. It is not necessary, therefore, to set the jaws up on the work as

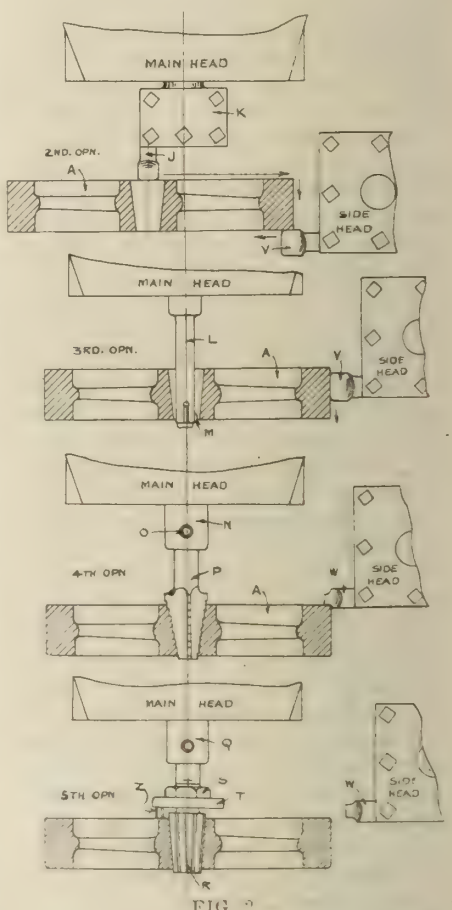

FIG. 2.

tightly as would otherwise be found advisable. With the exception of the reamers used for the tapered hole, the special tools required for this piece of work are of the forged variety, such as can be easily made up or bought ready for use.

### Operation Features.

The first operation on the work consists of facing the hub and upper surface of the rim with the tool G in the standard tool holder H of the main head turret. It will be noted that the projecting heads of the set screws E make it necessary to stop the machine when pass-

ing from the hub to the rim, or else raise the main head, and drop down again after traversing the head to the required point. It is preferable to stop the machine for a moment so as to avoid variations in the heights of the two surfaces which might be caused by errors in re-setting the main head turret. While the main head is working on the hub and rim, the side head is brought up and the tool U is started on the undercutting of the rim. It will be noted that this tool is so made that it will cut on the face or on either side, so that after the undercutting has been completed it is withdrawn and started on the outside turning as indicated by the arrow.

Referring to Figure 2, the remainder of the operations necessary to complete the piece will be found in sequence. The second operation is accomplished by the finishing tool J in the main head, being supported by the standard tool holder K, and during its operation the side head tool V continues the outside finishing and undercutting.

Before the outside face has been completed, the main head turret is indexed until the boring bar L is in position and the tool M is used to true the hole in preparation for the taper tools which follow. This truing operation is important, for there are apt to be variations in the cored hole which would produce an eccentricity if taper tools were used on the rough surface on account of their tendency to follow the hole. If, however, the hole is correctly generated a short distance with a single point boring tool, the subsequent tools will naturally follow the true hole, so that the work will be concentric when completed. While this truing is in progress, the outside has been completed by the side head tool V.

The fourth operation consists of roughing out the tapered hole with the roughing taper reamer P, the cutting edges of which are serrated to form a series of steps so that the chip is well broken up and the cutting action made easy. This reamer is of the floating type, and is secured in the holder N in the main head turret, the pin O acting as a driver. The shank of the reamer is a few thousandths smaller than the hole in the holder, and the hole through which the driving pin protrudes is somewhat larger than the pin so that a good floating action is assured.

The fifth operation is that of finish reaming the tapered hole, and between this and the previous operation, the tool W in the side head is utilized to slightly round the corners of the rim. The reamer R in this instance has straight flutes because the taper is a fairly blunt angle, so that there is very little danger of "drawing in." The spacing of the teeth may be unequal if desired in order to obviate any possibility of "chatter." If it were required to machine the hole to a very acute taper, it would be advisable to make the reamer with a left-hand spiral in order to prevent any tendency to "draw in." The spiral in a case of this kind should be from five to eight degrees. The shank of the reamer floats in the holder Q, and is provided with an adjustable collar T, having three pins which act as stops against the hub, so that the correct diameter of the hole may be easily maintained. The check nut S secures the collar in its determined position. This operation of reaming completes the first setting of the work.

Several points in the tool layout are worthy of comment: The construction of the jaws; the fact that replacements of the forged tools can be readily made, and the three-point contact of the reamer stop. The latter feature is important, in that any dirt or chips which may be lying on the top of the hub do not interfere with the action of the stop, as might be the case if a plain-faced collar were used.

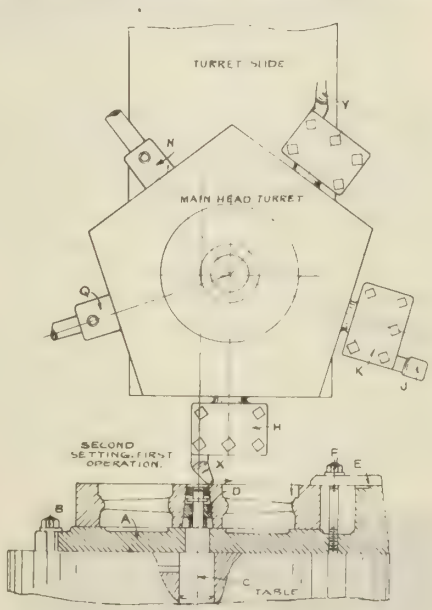

FIG. 3.

**Second Setting of the Flywheel.**

A peculiar condition obtains in the second setting of the work, because it is necessary to locate from the tapered hole and also to use the rim surface to rest the work upon. Now it would obviously be out of the question to locate the piece on a fixed tapered plug and on the faces of hub and rim at the same time, because there might be slight variations at these points which would cause the work to run "out of truth." A reference to the illustration, Fig. 3, will show the manner of providing for this variation and compensating for slight inequalities.

The work is placed on the fixture A so that the previously faced rim lies flat on the annular pad, the central location being obtained by the floating taper shell D, which is forced up into the hole by the coil spring beneath it, and is restrained from an excess of movement by the pin shown in the illustration. It will be readily seen that this method of locating compensates for slight variations between the tapered hole and the finished surfaces of rim and hub. The plug C which centres the fixture on the table is used as a guide for the tapered shell, locating bushing and the fixture itself is held down on the table by means of the bolts B which enter the table tee-slots. Three clamps E are arranged around the fixture and serve to clamp the rim of the flywheel down upon the annular pad. The studs F are used in place of a cap screw, so that the wear on the thread is not taken by the cast iron, but by the steel thread on the stud and nut. This method of construction is much to be preferred to a cap screw or bolt, which is tapped into the cast iron base of the fixture and the life of the thread is prolonged by its use.

Very little change is necessary in the tools for this setting. The roughing tool G in the holder H is replaced by the bent tool X, which is used to face the end of the hub and rough bore the inner surface of the rim which is indicated by the arrow. The boring bar L used in the first setting is replaced by another tool holder of standard make, in which is placed the finishing tool Y, which finish faces the hub and finish bores the inside surface of the rim. All the other tools in the main head turret remain as they were in the first setting of the work, and it will furthermore be noted that as the side head is not used at all in this second setting, it is, of course, unnecessary to disturb these tools, the side head being simply drawn back out of the way during this setting.

## INTERESTING CUPOLA INSTALLATION.

IN the November issue of the Journal of the American Science of Naval Engineers, a description is given of a foundry cupola of 600 lb. capacity, installed at the Puget Sound navy yard. It was constructed to avoid the great waste that followed the use of a 6,000 lb. cupola when only a few small castings were required, and was made largely from scrap material. It is only about 4 ft. high from the base, and the internal diameter inside the lining is 14 in. The tuyeres, two in number, are rectangular in shape and expanding, with their lower edges 10 in. from the bottom. The opening is 6½ in. wide at the broad end and about 5 in. at the narrow end, by 4 in. deep, and the ratio of cupola area to tuyere area is

approximately three to one. The bottom plate is a casting incorporating the spout, while the cylinder is made of steel plate. The blast is taken from the compressed air system of the yard. It induces air in a three-stage injector and delivers it to the cupola about fifteen times its own volume. The cupola is hinged at the front to the base so that it may be turned on its side for repairs and relining. It has proved entirely satisfactory.

## BASCULE BRIDGE AT SAULT STE. MARIE.

WHAT is claimed to be the longest bascule bridge in the world, crossing the United States ship canal at Sault Ste. Marie, Mich., has now been in successful operation for several months, and, aside from its record size, it presents many interesting and novel points in design. It is 355 feet in length between centres of front piers, or 336 feet from trunnion to trunnion, and has two folding leaves, which, as shown in Fig. 1, interlock in such a manner as to form a single rigid span from pier to pier.

The Sault Ste. Marie Bridge has its leaves of the Strauss heel-trunnion type, each leaf being formed of two riveted trusses, 168 feet in length and 55 feet deep, spaced 20 feet apart on the centres. They carry a single track for the Canadian Pacific Railway, forming a portion of the International Bridge across the St. Mary's River. The leaves are counterbalanced by heavy, overhead masses of concrete, which are suspended from counterweight trusses connected to the bascule trusses by parallel links. Each leaf with its mechanism is carried on a tower, the trunnion being located at the base of the framing carrying the bearing for the counterweight and counterweight mechanism.

The specially interesting feature of the new bridge is the arrangement made for allowing for expansion and contraction at one end of the span. This is accomplished by placing one entire tower with its leaf and counterweight on rollers, so that this end of the span is free to move when the bridge is closed, but when the open mechanism is in operation the tower may be held stationary. When the bridge is lowered, the bottom chords unite somewhat in the same fashion of an ordinary car coupling at a tension hinge, which can be locked so that the two leaves are joined together, and under a live load act as a single span from pier to pier. The bridge is operated from one operator's house by electricity, and may be opened and closed in 1¼ minutes. A hydraulic control with an oil pump enables the operator to adjust the position of the tower according to temperature.

FIG. 1. BASCULE BRIDGE AT SAULT STE. MARIE.

FIG. 2. BASCULE BRIDGE AT SAULT STE. MARIE, DETAIL FEATURES.

When it is realized that the superstructure is 426 feet long over all, including towers, the amount of contraction and expansion which must be allowed for can be readily appreciated. The entire structure contains about 1,400 tons of structural steel, and each bascule leaf with its floor system weighs about 400 tons. Although the bascule bridge has long ceased to be a novelty, yet the features incorporated in the present structure are so unique as to have aroused considerable attention. The system of top and bottom chord locks at the centre of the span provide for compression, tension and shear, and have been so carefully arranged that a strong and homogeneous structure has been secured.

## STRENGTH OF COPPER AT HIGH TEMPERATURES.

THE strength of copper at high temperatures was the subject of a paper by Dr. G. D. Bengough and D. Hanson at the September meeting of the Institute of Metals at Portsmouth, England. The results of investigation showed that the nature of the atmosphere was an important factor, an oxidizing one at a high temperature giving a high degree of ductility to copper.

In a neutral atmosphere, pure unannealed rolled copper retains all its superior strength over annealed copper at all temperatures from 20 to 1,000 deg. C. With pure annealed copper, fracture takes place through all crystals at all temperatures below 700 deg. C., while above 750 deg. C. it passes between the crystals with either possible course at intermediate temperatures. A range of low ductility was discovered at temperatures about 250 to 450 deg. C. While small amounts of oxygen and arsenic decrease the tensile strength at high temperatures, increased ductility was observed. In hydrogen above 720 deg. C. the tensile strength was about a half ton per square inch lower than in a neutral or oxidizing atmosphere.

As a whole the results of the tensile tests are consistent with the theory that the crystals of copper are enveloped in a cement which at low temperatures is stronger than the crystals themselves.

# Series of Practical Questions and Answers for Mechanics

*Every care is being taken to include only pertinent, practical questions, and give same direct reliable answers. Catch questions will be avoided. Arithmetic, consisting of simple addition, subtraction, multiplication and division will be found a useful companion study.*

## PIPING.

PIPING a steam or hot water heating plant may apear to be a very simple operation. The number of leaks which usually develop, particularly in the hot water heating systems of high buildings shows that there is much room for improvement in the care given to the thread cutting and pipe fitting in connection with this work. The carelessness of the average plumber for appearance is proverbial. This is more or less surprising when the small amount of thought and effort required to make horizontal pipes horizontal, vertical pipes vertical and to simplify the systems generally is taken into account.

The use of oakum or rope-yarn to make joints tight is to be condemned. At best it serves but to cover up a possible poor job and is thus a direct reflection upon the quality of the workmanship. There is nothing better than a metal-to-metal joint for any purpose.

The lengths of pipe required can be easily determined. The fitting is measured from its face to its centre, and the amount the pipe is required to enter the fitting is subtracted from this distance. The difference thus found is subtracted from the length of the pipe for each threaded end measured from centre to centre of fittings.

In piping for steam a number of simple rules are in use which greatly simplify the obtaining of dimensions. Most of these are based upon the fact that the maximum speed of steam flow in pipes is 6,000 feet per minute and is, in some cases kept down to 5,000 feet per minute. It is equally undesirable to make steam pipes too large as to make them too small, as the weight, cost of covering and radiation loss is greatly increased. For water piping the frictional resistance of the pipe to the flow of the water is the main consideration. This depends upon the diameter of the pipe, the number of bends or obstructions and the condition of the internal surface. The effect of bends and fittings is reduced by simple rules to a length of pipe which would provide the same resistance.

Steam and water pipes are rated by their inside diameters. The actual inside diameter of standard pipe, however, is always a little larger than the rated size. The rating of tubes, on the other hand, is based upon the external diameter and they are usually fairly accurate to this size. Any increase in the thickness of the tube requires a corresponding decrease in the inside diameter.

**Question.**—What sized steam-pipe should be provided for an engine with a 30-inch cylinder, a 36-inch stroke, and which runs at 90 r.p.m.?

**Answer.**—For a steam flow of 6,000 feet per minute the diameter of steam-pipe must be:

$$\frac{\text{Cross-sectional area of Cylinder} \times \text{piston speed in feet per minute}}{6000}$$

$$\frac{30\times30\times.7854\times36\times2\times90}{6000\times12}=63.617 \text{ sq.in.}$$

Doameter of pipe having area of 63.617 sq. in $=\sqrt{\frac{63.617}{.7854}}=9$ inches.

**Question.**—What horse-power engine could be served by a 9-inch steam-pipe?

**Answer.**—Multiply the square of the diameter by 6, or $9\times9\times6=486$ horse-power.

* * *

**Question.**—What amount of heat radiating surface would be provided by a coil composed of 370 feet of 1¼-inch pipe?

**Answer.**—Outside diameter of 1¼-inch pipe is 1.66 inches. Surface area = diameter in inches × 3.1416 × length in in.

$$\frac{1.66\times3.1416\times370\times12}{144}=160.797 \text{ sq. ft.}$$

* * *

**Question.**—What quantity of steam per minute would flow through a 3-inch pipe, 80 feet long, under a boiler pressure of 90 pounds and a discharge pressure of 50 pounds per square inch?

**Answer.**—Divide 3.6 by the diameter in inches; add one to the quotient and multiply by the length of the pipe in feet. (1)

$$\text{or } \frac{3.6}{3}=1.2;\ 1.2+1=2.2;\ 2.2\times80=176 \text{ (1)}.$$

Multiply difference between boiler and discharge pressures by the fifth power of the diameter and by the density at the boiler pressure. (2). Or 90—50=40; $40\times243\times258=250.7760$ (2).

Divide (2) by (1) and multiply the square root of the quotient by 87.

$$\text{or } \frac{2507760}{176}=1428;\ \sqrt{14248}=119.3$$

$119.3\times87=10379$ pounds.

**Question.**—A flange pipe joint of 3-inch pipe is subjected to a hydraulic pressure of 400 pounds per square inch. If the joint is packed with a sheet of leather ⅛ inch thick, and the flanges are smooth, what will have to be the pressure between the flanges to keep the packing in place?

**Answer.**—The total pressure on the packing is $\frac{3\times3.1416\times400}{8}=471.24$ pounds.

The coefficient of friction for leather on cast iron is .56. As friction acts on both sides of the packing, this becomes $.56\times2=1.12$, or the friction = 112 per cent. of the load. The force with which the bolts should be screwed up is

$$\frac{471.24}{112}\times100=420.75 \text{ pounds.}$$

* * *

**Question.**—What quantity of air could be delivered by a 2-inch pipe 100 feet long? Supply pressure is 90 pounds and discharge pressure is 86 pounds per square inch.

**Answer.**—Formula, $V=58\sqrt{\frac{pd^5}{WL}}$

where,

p = difference in pressure at two ends of the pipe.

d = inside diameter of pipe.

L = length of pipe in feet.

W = weight in pounds of 1 cubic foot of entering air.

V = volume of air in cubic feet per minute, or volume $=58\sqrt{\frac{4\times37.6}{.08073\times100}}$

$=58\sqrt{18.63}=58\times4.32=250.5$ cubic feet per minute.

**Question.**—Find the thickness of a cast iron pipe 6 inches inside diameter for a steam pressure of 200 pounds per square inch.

**Answer.**—By approximate rule,

$$\frac{\text{diameter in inches} \times \text{pressure in pounds}}{2,700}$$

$$=\frac{6\times200}{2700}=.444 \text{ inch.}$$

By exact calculation, projected pressure on section of pipe 1 inch long $= 6\times200=1200$ pounds. Part sustained by 1 thickness of pipe $=\frac{1200}{2}$ = 600 pounds. Strength of cast iron in tension = 15,000 pounds per square inch

which, with a safety factor of 10 becomes 1500. Thickness of pipe required

then is $\frac{600}{1500} = .4$ inch. So that the approximate rule gives a safety factor of about 10. For wrought iron use 4500 instead of 2700.

* * *

**Question.**—What quantity of water would be discharged by a straight 1¼ inch pipe 100 feet long under 50 pounds pressure per hour?

**Answer.**—Formula, velocity $= C\sqrt{\frac{hD}{L+54D}}$

where

C is a coefficient depending on size of pipe.

D is pipe diameter in feet = 0.104.

h is total head in feet.

L = length of pipe in feet.

Head in feet $= 2.309 \times 50 = 115.45$

or velocity $C\sqrt{\frac{115.45 \times .104}{100+5.616}} = 24\sqrt{.113676}$

$= 24 \times .3371 = 8.09$ feet per second.

Discharge in cubic feet per second = velocity in feet per second × cross-sectional area of pipe in square feet. or

discharge $= \frac{8.09 \times 1.2272}{12 \times 12}$. Discharge in cubic feet per hour

$= \frac{8.09 \times 1.2272 \times 60 \times 60}{12 \times 12}$, or in gallons per hour $= \frac{8.09 \times 1.2272 \times 60 \times 60 \times 6.16}{12 \times 12}$

= 1527.67 gallons per hour.

* * *

**Question.**—What would be the loss of heat per hour from a steam pipe 60 feet long 4 inches in diameter carrying steam at 140 pounds gauge pressure in a building where the average temperature is 60 degrees F.

**Answer.**—A bare pipe loses heat at the rate of 2.7 B.t.u. per hour per square foot of pipe surface for every degree difference between the temperature of the pipe and that of the surrounding air.

The temperature of steam at 140 pounds is 360 degrees.

Difference of temperature is 360 —60 = 300 degrees.

Surface area of 60 feet of 4-inch pipe is $\frac{4.5 \times 3.1416 \times 60}{12}$ = 70.68 sq. ft.

Heat radiation is $70.68 \times 2.7 \times 300$ = 57,250 B.t.u. or is the equivalent, with an average boiler, of $\frac{57250}{8400} \times 24$

= 163.6 pounds of coal per day.

## UNIVERSITY OF TORONTO AND THE EUROPEAN WAR.

THOUGH the military organizations of the Canadian colleges were in a much more rudimentary condition than those of the British Universities, a large contribution has already been made to the army for the present war from their graduates and undergraduates. The following is an account of what has been done by the University of Toronto:

### First Contingent.

Officers—Lt.-Col. C. H. Mitchell, B.A.Sc., member of the Board of Governors; Lt.-Col. R. D. Rudolf, Professor of Therapeutics; Lt. Col. W. A. Scott, Associate in Surgery; Major P. Goldsmith, Demonstrator in Oto-Laryngology; Captain G. R. Philp, Demonstrator in Anatomy; Captain P. K. Menzies, Assistant in Clinical Surgery; Captain G. A. Cline, Instructor in University Schools; Captain C. E. Cole, Demonstrator in Therapeutics; Dr. B. E. Clutterbuck, Assistant in Gynaecology; Dr. A. J. Mackenzie, Demonstrator in Medicine, and Mr. E. Owen, Lecturer in German.

According to most recent information there are, besides the members of the staff, 134 graduates and 86 undergraduates, and of these 137 are officers and 83 privates. The chief electrician and several of the laboratory assistants are also on service, and their places are being kept for them. Professor de Champ, and Messrs. Balbaud and Bibet of the Department of French in University College have been serving with the French Army since the beginning of the war.

### Second Contingent.

Officers—Lt.-Col. Fotheringham, Associate-Profesor of Clinical Medicine, is Chief Medical Officer. Other members of the staff who have been giving their time in preparing for its mobilization are: Captain J. A. Amyot, Professor of Hygiene; Lt.-Col. J. A. Roberts, Demonstrator in Clinical Surgery; Lt. G. B. Strathy, Demonstrator in Clinical Medicine; Lieut. Bruce Robertson, Assistant in Pathology.

At present our information is quite incomplete, but we understand that 53 graduates and 63 undergraduates have been accepted.

At the opening of the present session the Caput, Senate and the Faculty Councils passed regulations to provide that standing should be granted to those who by reason of enlisting had been unable to take their September supplementals; also, that those who had enlisted or who would do so, should be shown the utmost consideration at the end of the session that the University's duty to the public in maintaining professional standards will allow. It was further decided to discontinue all teaching and laboratory work after four o'clock in the afternoon in order to enable students to takes the courses of drill and instruction required by the regulations of the Officers' Training Corps.

### Officers' Training Corps.

In view of the probable establishment of an Officers' Training Corps in the University, a score of junior members of the staff began about September 15 to take drill and instruction to qualify themselves to become officers in the new corps. About October 20, authorization was received from the Militia Department. Dr. W. R. Lang, Professor of Chemistry, who with the concurrence of the Board of Governors had volunteered for active service but was appointed Instructor for this Military Division, was made Colonel of the new corps. Messrs. C. S. McVicar, A. D. Le Pan, G. N. Bramfitt, C. H. C. Wright, R. H. Hopkins, G. H. Needler, F. C. A. Jeanneret, L. Gilchrist, M. W. Wallace, G. O. Smith, C. N. Cochrane, C. V. Massey, G. M. Smith, E. J. Kylie, G. S. Brett, E. S. Ryerson, A. F. Coventry, G. Gallie, W. F. McPhedran, R. G. Armour, D. Graham, C. R. Young, D. G. Hagarty, A. M. Thomas, A. W. McConnell, W. M. Treadgold, B. M. Morris, H. H. Madill, J. R. Cockburn, J. R. Mitchener, V. E. Henderson, H. R. Hopkins, A. R. Leggo, W. S. Wallace, H. G. Manning, all except three being members of the staff, have been appointed officers. The students enrolled enthusiastically, and though the strength authorized as yet is only 1,000, over 1,800 have been taking drill.

On Friday, January 22, 1,500 students with their officers were reviewed by His Royal Highness the Duke of Connaught. He addressed them in part as follows: "I wish to express to you my very great satisfaction with the splendid turnout you have given me this evening. When I looked at you and saw how you stood to attention and the admirable way in which you marched past, I saw that your work since you were formed, a very few months ago, has been performed with a will, and I can honestly say that I have never seen better results than you have shown me to-day. What pleases me still more is the splendid example you young gentlemen are showing to the whole of Canada. You have come forward at a moment when every man that is able to do anything to help the Empire in a time of stress is needed, and you have done so readily and in a most efficient manner.

### The Women Students.

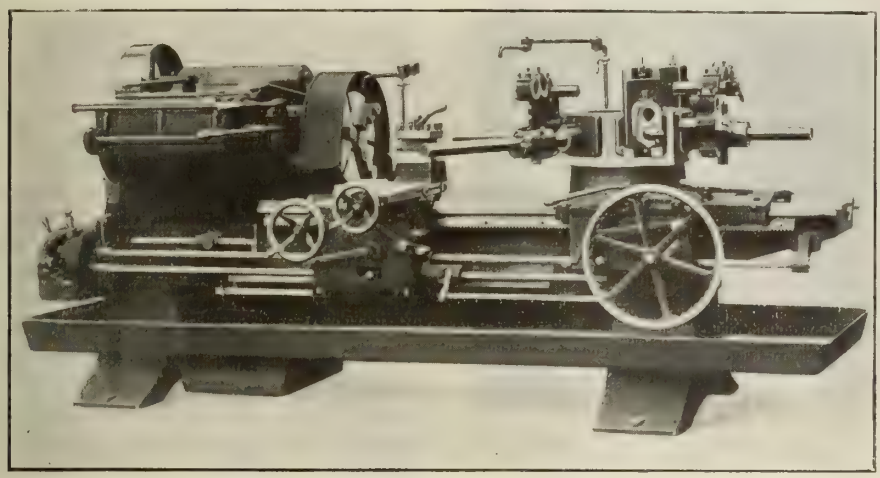
The women students of the University have also shown their determination to be of service by occupying the hours from four to six in the afternoon, when there is no instruction given in the University, with sewing and other work for the Red Cross Society.

# PROGRESS IN NEW EQUIPMENT

## A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

### UNIVERSAL HOLLOW-HEXAGON TURRET LATHE.

THE latest product of the Warner & Swasey Co., Cleveland, Ohio, is an improved model of the Universal Hollow-Hexagon Turret Lathe, the improvements applying to both the 2-A and 3-A machines; but as the 3-A was the first to be completed, the description will be confined to that machine.

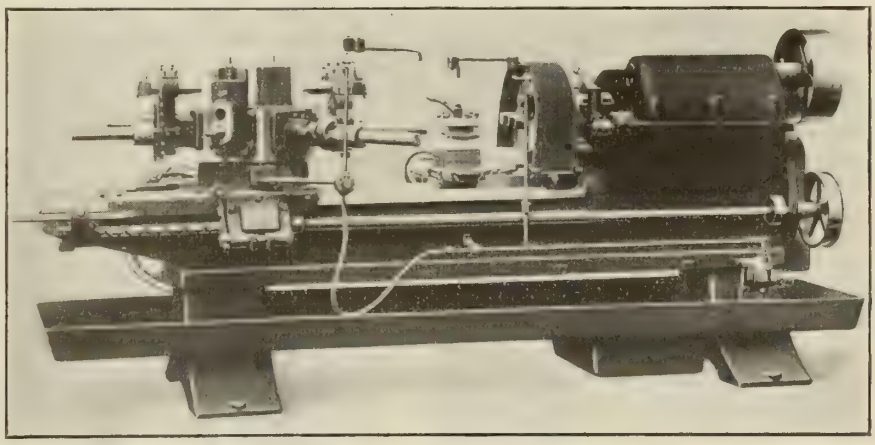


UNIVERSAL HOLLOW-HEXAGON TURRET LATHE. FRONT VIEW WITH CHUCKING EQUIPMENT.

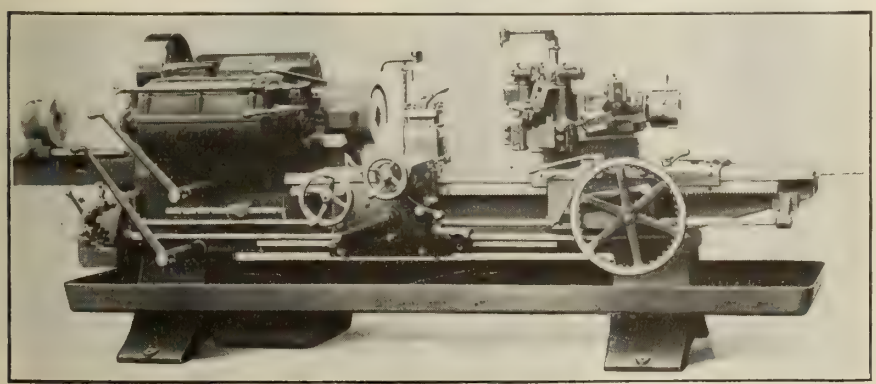
The most noticeable change is in the design of head. The former head has been superseded by one entirely new in type, and with gears running in oil. Not so apparent, but perhaps of greater importance, are the increased working range, the greatly increased power of the head, the corresponding increase in the rigidity and strength of the bed and the two carrying units, as well as the larger and more rigid tools. These changes have resulted in greatly increased capacity and efficiency of the machine.

The greater capacity has been attained without noticeably increasing the size and operating dimensions of the machine; in fact, the new model is more compact than the former one. The automatic chuck of the No. 3-A machine now takes round stock up to 3½ inches, and the length turned has been increased to approximately 40 inches. The swing over the cross slide carriage has been increased to 17¼ inches, and the maximum swing of the machine to 21½ inches. The capacity of the No 2-A machine has been correspondingly increased.

Although the earlier model was a most powerful machine, the new unit has power and rigidity greatly in excess of requirements. The new geared head, with the 5-inch belt running on the 16-inch diameter pulley, is capable of delivering 14 horse-power, with a large overload factor, this amount of power being required only when machining heavy steel castings or forgings and making several cuts simultaneously. The rigidity and strength of the bed, the two-tool carrying units and the feeding mechanisms for same are well in proportion to the power delivered by the head to the work. The tools are re-designed in keeping with the increased capacity, and are of more rigid construction. The splash system of continuous lubrication employed in the head, with the gears running in oil, insures a steady stream of lubricant. This reduces to a minimum the fractional loss of power in the head, and affects at the same time a very decided increase in the life of the machine.



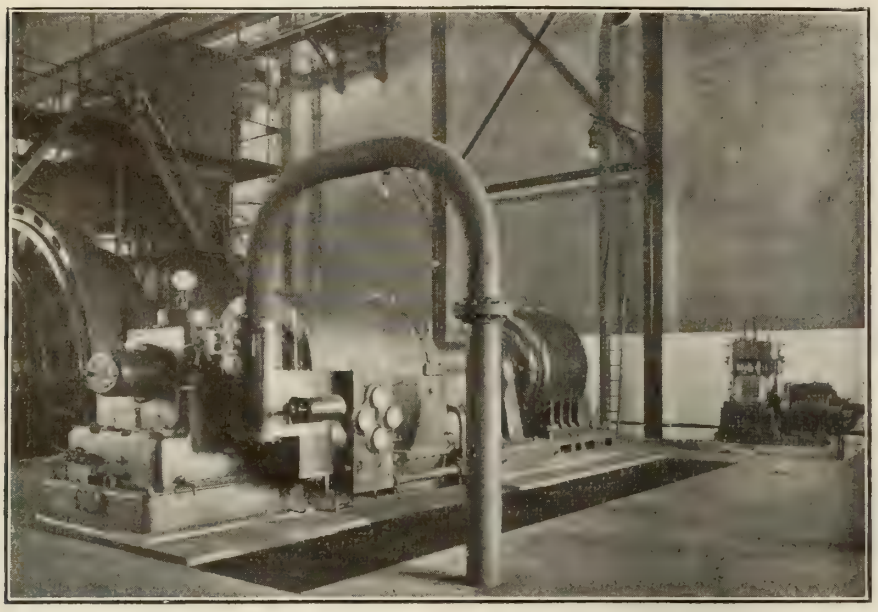
UNIVERSAL HOLLOW-HEXAGON TURRET LATHE. REAR VIEW WITH CHUCKING EQUIPMENT.



UNIVERSAL HOLLOW-HEXAGON TURRET LATHE WITH BAR EQUIPMENT.

The pan has been placed lower to give increased space for chips, and to assure easy accessibility to those parts of the machine directly over it. The legs have been re-designed in semi-box type and with a very wide spread, to assure a solid support and freedom from vibration, while the turnstile operating the turret saddle has been superseded by a large hand wheel. The turret and carriage are power operated simultaneously, with the feeds independent of each other. By this means two distinct operations can be made at the same time—as for example, boring with the turret while the carriage is facing or recessing

and cutting off. As many as eleven tools may be placed in operation with one set-up. Through a variety of combinations, feeds ranging from 10 to 218 are produced. The machine has twelve spindle speeds, both forward and reverse, with ten feed changes in each direction for both carriage and turret. The feed changes are controlled by the feed box at the head end of the machine. The spindle speeds range in geometrical progression from 8 to 250.



MAIN TURBINE AND GENERATOR UNIT, WITH OLD UNIT AT LEFT REAR AND EXCITER UNIT AT RIGHT.

As in the earlier type, the head is cast solid with the bed to assure maximum strength and rigidity. It is of the single-pulley type, and may be belted directly to the line shaft or to a constant speed motor. Taper turning and screw chasing attachments are furnished when desired. The taper attachment turns tapers up to 1½ inches to the foot, in lengths of 15 inches, while the screw chasing attachment cuts from 2 to 48 threads any pitch. Each leader will cut 3 pitches that are multiples of 1, 2 and 4 of its own thread.

Notwithstanding the great power and range of the machine, every facility has been provided to make it easy and quick of operation. The power rapid traverse of the turret saddle facilitates this. The independent adjustable stops for both the turret saddle and the carriage reduce setting-up time to the minimum, and the hollow hexagon turret permits tools to be bolted from the inside, assuring maximum use of each face of the turret, with full support for the tool in the direct line of thrust and torsional strains. In short, the adaptability is such that in actual practice this machine has been found economical where but a few pieces of a kind are to be finished frequently as few as six pieces—as well as for specialized manufacturing work. These features, together with great power, rigidity, and accuracy, contribute to render the machine most highly efficient. Being equally adaptable to bar and chucking work, and with standard tools suitable for a large range of everyday needs, it will also be found most economical for a great variety of work.

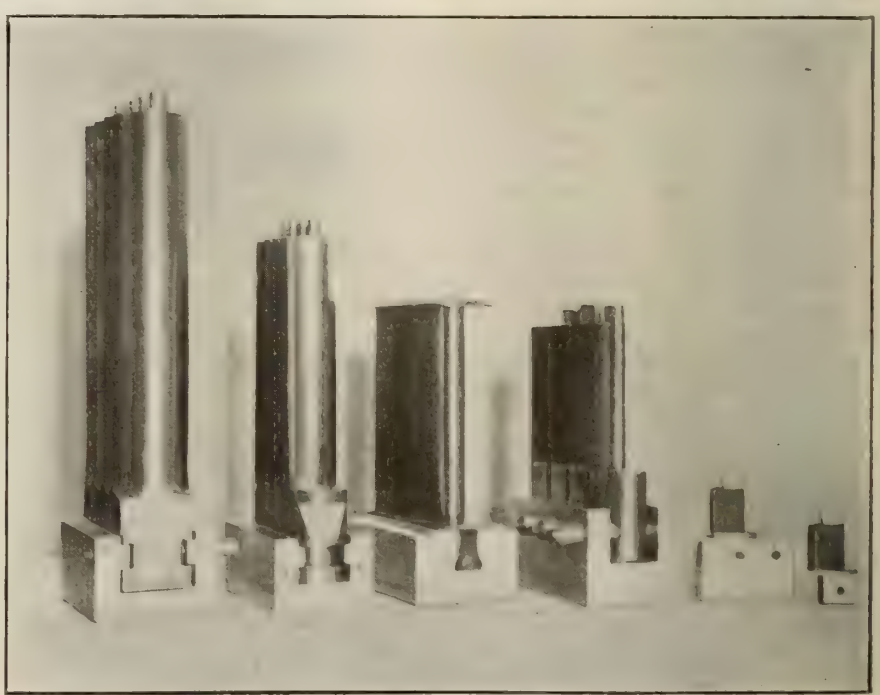
## NEW TURBINE EQUIPMENT, MONTREAL TRAMWAYS CO.

A NEW Belliss & Morcom steam turbine has recently been installed and put into operation at the Hochelaga Power House of the Montreal Tramways, and is an important addition to the already installed turbine equipments in Canada.

The Belliss turbines have many novel points in design, which will be mentioned later, perhaps the most outstanding feature being the moderate speeds at which they run. Although for long the foremost exponents of quick revolution engine manufacture, their practice from the first has been to advocate moderate speeds in turbines, and only in very exceptional circumstances when the conditions are specially favorable are they willing to offer speeds exceeding 1,800 r.p.m. on high pressure turbines above 1,000 kilowatts.

There is little doubt that the factor of safety of the moving parts of large turbines running at speeds of 3,000 to 3,600 r.p.m. is extremely small, and exists irrespective of the design, and many of the serious acidents that have occurred must be attributed to this cause. When it is realized that a 5-ounce blade at these higher speeds may readily develop a force of 2,000 lbs. due to centrifugal action, the difficulty of design becomes apparent. It cannot, on the other hand, be disputed that the slow-running turbine has a more conservative factor of safety, and is, therefore, a quieter and more reliable machine.

The unit installed by the Montreal Tramway Co. will be used to carry peak loads, also as a standby, and consists of a 2,000 k.w. turbine running at 1,800 r.p.m., connected to a Swedish General Electric Co. alternator. The turbine is designed to operate with 200 lb. steam pressure of a temperature of 570 degrees Fah., and for a twenty-four-hour 25 per cent. overload, as well as a 50 per cent. overload for a period of two



STANDARD METHODS OF ATTACHING BLADES.

hours. Under full load conditions, the steam consumption guaranteed is 9.8 lb. per b.h.p. when exhausting into a vacuum of 28 inches.

### Turbine Constructional Features.

The blading is wholly impulse, and consequently there are no close clearances between the moving and fixed blades; thus precluding the possibility of these fouling. The first stage of the turbine is disc built and carries two rows of Curtis steel blading, compounded for velocity. The remainder of the turbine is drum built, with a series of phosphor bronze blading compounded for pressure. The drum is of forged steel with a through running shaft which ensures permanent alignment and a rotor very free from whip. The moving blades are attached to the disc and drum by a patented dovetail device which gives absolute rigidity, at the same time allowing individual blades to be readily replaced.

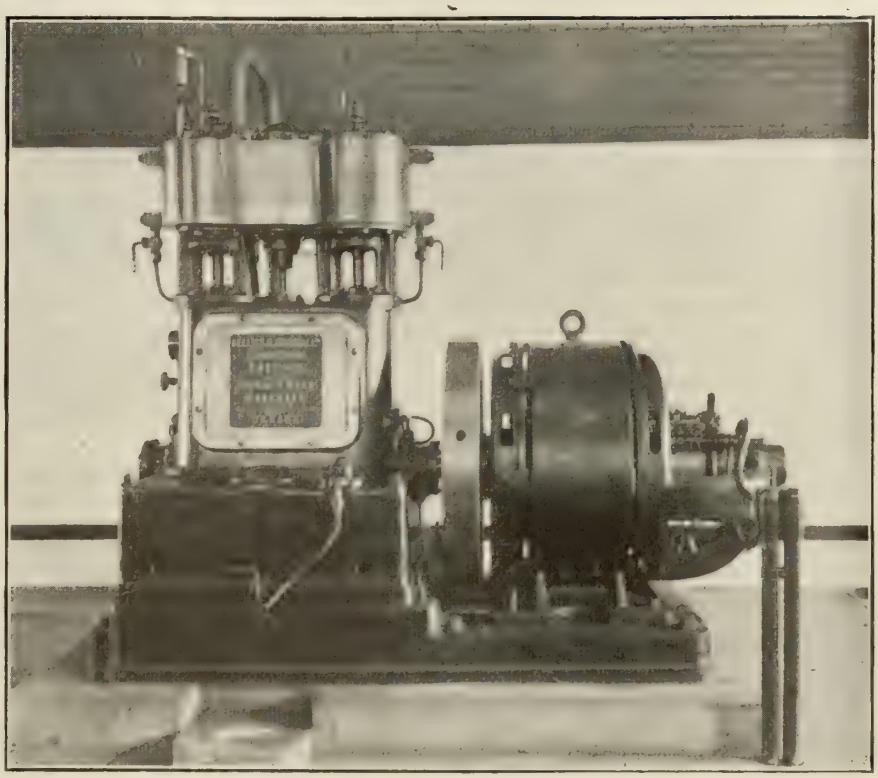
The critical speed of the rotor on account of its great strength and low velocity is far in excess of the normal working speed, and is never attained under ordinary conditons. The nozzles or fixed blades are attached to steel diaphragm plates and are of segmental construction. A Mitchell thrust is fitted, and the blocks are readily renewable. A Hoffman ball thrust is also provided as an emergency, and by an ingenious arrangement does not come into operation unless the main thrust fails.

### Governor Feature.

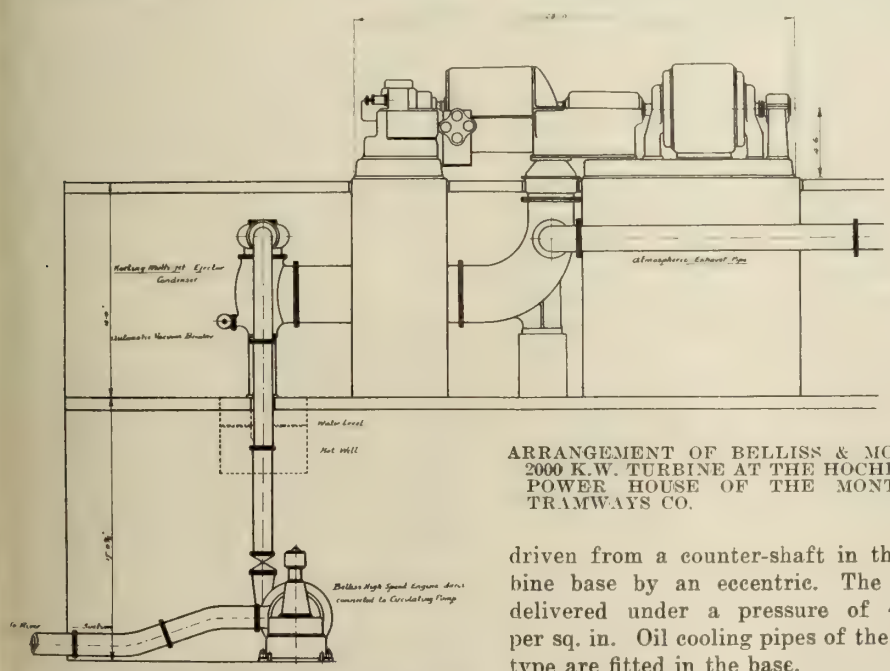
The main governor acts on the throttling principle and is of the centrifugal type similar to that fitted on the Belliss high speed engines. It is driven from the tail-shaft by a worm gear. An emergency governor, consisting of a radial hammer opposed by an adjustable spring, is also fitted. Both governors operate separate oil relay systems, the main relay being on the usual dog lever principle, and the emergency relay of a special type acting as a dash-pot to close at a predetermined speed or on the failure of the oil supply; it may also be readily tripped by hand.

The oil pump is of the double-acting valveless type running at 100 r.p.m., and driven from a counter-shaft in the turbine base by an eccentric. The oil is delivered under a pressure of 40 lb. per sq. in. Oil cooling pipes of the Royle type are fitted in the base.

The turbine is connected to the alternator through a flexible coupling which runs under forced lubrication and ensures perfect alignment, and the whole of the turbine gear is completely enclosed, all moving parts being subjected to forced lubrication. The thrust and governor gear are readily accessible through large inspection doors conveniently arranged in the casing.



EXCITER UNIT INDEPENDENTLY STEAM DRIVEN.



ARRANGEMENT OF BELLISS & MORCOM 2000 K.W. TURBINE AT THE HOCHELAGA POWER HOUSE OF THE MONTREAL TRAMWAYS CO.

### Accessory Equipment.

The exciter consists of a Belliss & Morcom vertical compound high-speed engine direct connected to a Swedish General Electric Co. generator having a normal output of 35 k.w. at 575 r.p.m.

A Korting multi-jet ejector condenser is situated directly beneath the turbine and is capable of maintaining a vacuum of 28½ inches under full load conditions.

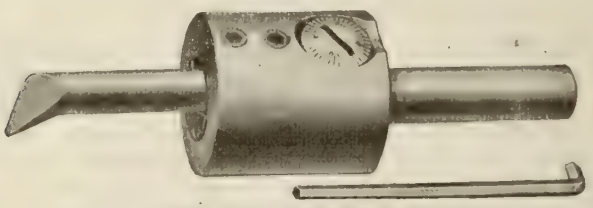
A centrifugal circulating pump is provided in the basement direct connected to a Belliss & Morcom vertical compound engine running at 475 r.p.m., drawing water from the river adjoining, and delivering it to the condenser under a pressure of 10 lb. per sq. in.

The turbine under all conditions of load is exceptionally free from vibrations and is an excellent example of high-class design and workmanship. A similar unit was installed for the city of Calgary, Alta., some twelve months ago, and a 750 k.w. mixed pressure turbine is now being erected for the International Coal & Coke Co. at Coleman, Alta.

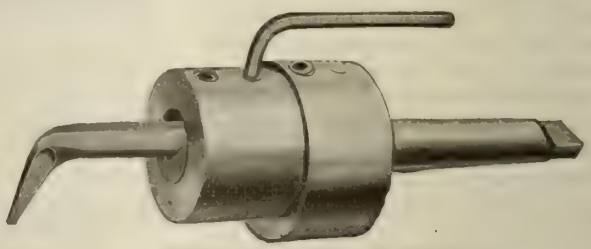
The whole installation was carried out by Laurie & Lamb, Montreal, the Canadian agents for Belliss & Morcom, of Birmingham, England.

## NEW STYLE BORING HEADS.

TO meet the demand for boring heads smaller than their regular type, the Marvin & Casler Co., Canastota, N.Y., have brought out two new styles, to be known as models C and D. The construction of model C is practically the same as that of the line of large heads manufactured by the firm, but, in order to reduce the size to a minimum, the regular drill chuck used in the large size heads has been replaced by a hardened V block and set screws for holding the tools, Two set screws are used, ensuring a rigid grip of the tool. The V block is carefully aligned so that twist drills within the range of the chuck can be brought to run true by adjusting the offset through the micrometer screw. It is provided as in the larger sizes with a take up ring which keeps the moving parts in close contact. The V block grip enables the operator to use tools with round or octagon shanks of various sizes to meet requirements of the work; small size tools for small holes or larger size tool shanks for larger holes. The micrometer screw is graduated to read to .001. It makes a very desirable tool for small work, and with the shank as a part of the tool, it is ready to use when received.



NEW STYLE BORING HEAD—C.



NEW STYLE BORING HEAD—D.

The style D head consists of a shank and body, across which is moved a head or chuck which carries the boring tools. The offset adjustment is secured by two opposing hollow set screws threaded in the body, the inner ends resting against a cone shaped extension of the chuck. The adjusting screws are set at an angle to correspond with the cone shaped extension of the chuck, so that they act similar to a gib and draw the chuck firmly against the outer face of the body, and at the same time lock the chuck and tool in position for depth of cut. The tool is set for depth of cut by releasing one of the opposing set screws and following up with the opposite screw. The tools are rigidly held in a hardened V block by two hollow set screws, and either round or octagon tool shanks varying in diameter within the limits of the chuck can be used.

## DON'TS FOR DROP FORGERS*

by W. L. Goodrich

DON'T put too much oil on the die during forging as it may check or burst.

Don't keep a die in a cold place after hardening, particularly if it has not been drawn properly.

Don't put a cold die block into a hot hardening or annealing furnace. Heat both up together.

Don't have any dark spots on the blocks when taken from the furnace. They should be the same color all over.

Don't use cyanide on the face in hardening die blocks, as it will cause the sharp corners of the block to break off.

Don't have the furnace too hot when heating the die blocks for hardening, as it is not the furnace that you want to harden, but the blocks.

Don't try to make the die do too much. Do as much breaking down as possible and allow the finishing dies to do as little as possible.

Don't draw a die block too fast after hardening; it is better to leave it on the hot plate or in the furnace one-half hour too long than not long enough.

Don't keep a die in the cooling water too long. Take it out as soon as the fingers can be held on the deepest part of the impression without burning them.

Don't put too much water on the shank of the die blocks. Only sufficient water should be put on the shanks during the cooling of the face to prevent distortion.

Don't break the corners on a die block by having them too hot. To aid in preventing breakage of corners of a die block during hardening, soap or oil the sharp corners before putting it in the water.

Don't allow the steal in forging to get too cold as it is very likely to crack the die, particularly where the impressions are deep and tapered. Excess material will also cause dies with deep impressions to crack.

Don't start up the hammers in cold weather without first preheating the dies; the dies may break if they are not heated before using. This accounts for the greater number of dies broken in cold weather than in warm weather.

Don't delay drawing the temper. As soon as the block has cooled so that the deepest impression will not burn the fingers, it should be immediately placed in a drawing furnace or drawn on a hot plate, shank down. This drawing should take place immediately after the block is taken out of the water.

Don't blame all the breakage of die blocks on the steel or the die block manufacturer. If a die block had a hole about one inch diameter drilled through the centre of it longitudinally, it would prevent the block from breaking, if the block should have a pipe. Drilling, of course, is only a precaution against piping.

Don't use still water for hardening a die block. The blocks should be immersed to a depth of about three inches in running water. This running water should have sufficient force to penetrate the steam film that forms when a piece of steel is cooling. By having a good flow of water and good force, soft spots will not appear in the working face of the block.

Don't allow the shoes in the hammers to get out of shape. One-sixty-fourth inch warpage in the shoe will very frequently break a die. shoes are frequently distorted, due to the fact that short dies are used for a certain length of time and then long dies are used on the same shoes, without dressing them. This will distort the shoes and break the die-blocks.

Don't heat a block fast. A rough and ready rule for the length of time a die block should be heated is one hour for each inch of thickness, plus one hour. In other words, a block eight inches thick should be heated about nine hours. It is better for the blocks to stay in the furnace an hour too long and thereby insure that they are heated throughout, than not to have them in the furnace long enough.

**Prompt Shipment Record.**—A record for prompt shipment was recently made by the Whiting Foundry Equipment Co., Harvey, Ill., on an order for a three-motor electric traveling crane, 10 tons capacity, 30 ft. span. Telegraphic order was received at their plant January 23, calling for delivery of crane complete on purchaser's runway at New Bridge, Del., February 10, 1915. Drawings were made, crane constructed, and shipment made January 29, 1915. Crane reached New Bridge February 4th, and was erected complete ready for service February 6th, or four days ahead of schedule time.

## THE CANADIAN NICKEL QUESTION.

IN spite of the most emphatic official statements to the contrary, there is apparent a lingering suspicion both harbored and expressed that nickel products of our Dominion are finding their way into enemy hands, and, to the man in the street, the situation appears to become daily more perplexing. He believes himself to be the goat of either an "Ananias Club" officialdom or, through over-sensitiveness, the victim of a "Doubting Thomas" gang.

It is not in any sense reassuring, however, to find that the Ontario Government has decided to appoint a Nickel Commission to make an exhaustive investigation into the matter, nor is it any more so to realize that any report arising therefrom may not most probably be received until after the war is over. In any case, as generally happens, the patriotic feature will doubtless be sacrificed for that of party.

Numerous applications have, we understand, been received for the post of commissioners, of whom there will be three, but meantime one only has been decided upon as suitable, although his acceptance has not yet been indicated. There is difficulty it appears in getting men with the necessary qualifications, and this is not to be wondered at when we are officially told that the Commission will be expected to find some means of refining Ontario's nickel ore within the Province, and failing this, their appointment is supposed to constitute an opportunity to invent a means.

Money, as in every other feature of our complex existence, with a few rare exceptions, will refine Ontario's nickel ore within the provincial boundaries, just as it may also defeat that objective. Money will also enable Germany to procure our product and is doubtless doing so if the suspicions of the "Doubting Thomas" brigade prove to be well founded. We are giving of our manhood and substance for the cause of Empire and the rehabilitation of Belgium and France, yet there appears to be no absolute assurance that we are not also being made the medium to offset these gifts. Canada has been and still is being exploited by insiders as well as outsiders in almost endless, subtle and devious ways, and little surprise will be evidenced if sooner or later we awaken to the knowledge that the enemy got our nickel, our patriotism notwithstanding.

The hearts of our people are deeply stirred on this question of our nickel export destination, and their demand is that all quibbling on the one hand and cavilling on the other should cease. Britain's navy can be relied upon to prevent direct shipment to Germany, but not necessarily, through neutral countries, indirectly to her. Canadian statesmanship can, if it is worthy the name, make the latter contingency as impossible as the former; otherwise let that statesmanship take the bit between its teeth and admit its failure. The man on the street has more brains and more intelligence than he generally gets credit for, and in nineteen cases out of every twenty he not only has more, but uses them to more intelligent purpose than do his so-called leaders and administrators.

This nickel refining business has, we believe, more to it than any political-party-appointed-and-directed Commission will be able to unearth, however capable and conscientious its individual constituents. The principal producers of nickel from Canadian ore are the Mond Nickel Co., with its refineries in Wales, and the International Nickel Co., with its refineries in New Jersey, U.S.A. The former, as we might assume, is a British concern and the latter is American.

The nickel refining process has always been regarded as of a more or less secret nature, and reasonably so, because of the fact that most published matter relating thereto has been remarkable for its important detail feature omissions. Again, the cost of the process is reputed to be high, both from a material and labor point of view. Just then what Ontario's Nickel Commission will make out of their task—barring the pocketing of good fat salaries, is somewhat problematical. One thing is certain, however, a report will be presented, but we are not too sanguine that its achievement will amount to more than the distinction of being filed.

For the present or for the duration of the war, there is no real urgency for our embarking on a nickel refining enterprise, but there is real urgency in our people being absolutely assured that the product of our Canadian mines is being used as fully as requirements call for on our behalf, and that not an ounce of it is being used against us.

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

Montreal, Que., March 1, 1915.—Industrial conditions have not manifested many changes during the past week. Business in steel has been very quiet. The spring building has not commenced to come in, although the increasing number of inquiries would indicate that orders in this line will soon be on the books of various concerns. Business in structural work from Europe has been under consideration for some time past by various American and Canadian firms, and some of them have their representatives overseas now soliciting orders. Pig iron still remains very quiet. Machine tools do not present much activity, although the manufacture of shrapnel shells continues to create a demand for a certain class of tools. Metals have not been active during the week, but prices have had a tendency to stiffen.

#### The Steel Market.

The manufacture of forgings for steel shells has kept many eastern mills busy of late, and the Algoma Steel Corporation have been quite busy filling rail orders. Generally speaking, the volume of business passing is small. In the neighborhood of Pittsburgh, Carnegie interests are expected to buy steel scrap and this had a tendency to bull the market. On the other hand, however, other mills, with one possible exception, have

manifested no interest whatever, and this has had a bearish influence; thus dealers in scrap steel are in a quandry as to how best to interpret the situation. The railways have done little purchasing of late owing to their reduced revenues and the steel interests suffer more than perhaps any other line, because of this.

### Pig Iron.

Pig iron business is practically dead. Such large supplies were purchased early in 1914 at the low prices then prevailing that with the curtailment of our manufacturing owing to the war, these supplies are more than ample to take care of present needs. The recent increases due to the new tariff will tend to make business still quieter for some time to come.

### Machine Tools and Supplies.

The same rather peculiar situation in machine tools continues to exist from week to week. The demand for shell-machinery continues to increase and producers of these machines are working overtime to fill contracts, the deliveries of which are far too slow to suit the various purchasers. In other lines business is very quiet. The supply business keeps up well and is even increasing because the steel industry is assuming greater proportions each week.

### Metals.

Business in metals during the last week has been somewhat better than that of the immediately preceding week. Prices generally have stiffened. Copper, however, is selling the same as last week. It is rather a matter for speculation as to which way the price will go. If naval operations in the European waters are such as to render the shipping of copper too risky, the price will drop as the supply accumulates on this side of the Atlantic. However, if shipments continue the price will likely rise a little.

Tin is up one cent a pound. The market is in rather an upset condition although supplies are quite adequate for all demands.

Spelter has increased in price and is now selling at eleven cents. This market too is very unsettled.

Lead has experienced a little stiffening in price and stocks on hand are fairly large.

Aluminum was featureless during the week, the price remaining the same with no indication of a change.

Antimony has been quiet but firm, no possibility of obtaining any of this metal from European sources being immediately in prospect. It is rumored that Russia has purchased large quantities from China and Japan and the supply for American requirements looks very slim indeed.

The London Exchange closing quotations to-day were:—*Standard tin £183; copper £64⅝; lead £20¼; spelter £43.

*Tin up £3 per ton to-day.

---

**Toronto, Ont., March 2, 1915.**—There has been no appreciable change in business conditions this week. Trade is quiet in most industries, except where factories are engaged in the production of military equipment. The tariff revision has caused some inconvenience in business circles, but the necessary adjustments are gradually being made. Business does not seem to have been materially affected by the higher tariff. Buying has been on a more or less restricted scale for some time, and consumers will have to buy for urgent needs, regardless of the extra cost. There has been a general advance in prices on imported goods to cover the extra duties, and also, in many cases, on domestic products on account of the increased cost of raw materials. Other increases are contemplated, and in some instances price lists have been withdrawn pending a revision.

The steel trade is dull, but the outlook is improving, and prices have stiffened. There has been less activity recently in machine tool circles, but there will no doubt be a revival as the shell industry develops, indications pointing towards this. Prices on machine shop supplies are still being revised. Scrap copper and brass have advanced ½c per pound, but business is very light.

### Steel Market.

There is no change in the general situation in the iron and steel trade, it being still comparatively dull. Orders for shells are increasing in volume, and some business is being booked on account of other orders for military supplies. Indirectly the steel trade is deriving further benefit from the war, as regards extensions and improvements to factory buildings and plants. The outlook is improving, and it is expected that the new tariff will have a generally beneficial effect. There are no changes of note in quotations, although prices have stiffened. Galvanized sheets are firm and unchanged, but an advance is probable. The steel trade in the United States continues to improve, and mill operations are showing more activity. There has been another advance of $3 a ton on galvanized sheets, due to the high price of spelter.

### Pig Iron.

The situation with regard to pig iron shows no improvement. The demand continues light, and the advanced prices will not improve the outlook.

### Machine Tools.

The demand for machine tools in connection with the shell industry has fallen off, although there are still a number of inquiries being received from firms which are contemplating working on shell orders. There are, however, possibilities of further developments in the shell industry. Although fewer orders for 15-lb. and 18-lb. shells are being distributed, it is understood that lyddite shells and also shells of larger calibre will be manufactured in Canada. This will give a further impetus to the machine tool business. Apart from this, local dealers report dullness. Interest will be revived by the specifications for new equipment for the new Toronto Technical School, which will be found in the Industrial News Section of this issue. The list includes wood and metal working lathes, foundry, forge and machine shop equipment.

### Supplies.

The demand for machine shop supplies is showing some improvement. There have been some more price changes; bolts, nuts and screws, iron rivets and proof coil chain being affected. Other lines, such as leather belting, rope, linseed oil, are expected to advance. Prices have been withdrawn on milled screws and nuts pending a revision of the lists. There is a better demand for the best grades of high-speed tool steel from shell manufacturers.

### Scrap Metals.

The market is dull and very little business is moving. Prices on all grades of copper. The new prices are given ½c per pound, due to the increased cost of copper. The new prices are given among the selected market quotations.

### Metals.

Business is quiet in the local markets, but prices are firm, due to the strength of the primary markets. Tin and spelter have both advanced, but other metals are unchanged.

The tin market is firm in London, particularly as regards futures. The local market has advanced 1c, tin being now quoted at 44c per pound. The copper market is quiet and unchanged. There is no improvement in the export and shipping situation, the same difficulties in this respect continue. Local quotations are firm at 16½c per pound for lake copper. The extraordinary condition in the spelter market continues, and the situation is strained. Quotations are ½c higher, but purely nominal at 11¼c per pound. The lead market in New York is quiet, but very strong, and higher prices are anticipated. Lead is firm in the local market at 5¾c per pound. Antimony is firm, but unchanged, at 20½c per pound. Aluminum is unchanged at 23½c.

---

**St. John, N.B., Feb. 27, 1915.**—Despite the fact that the war has had a tendency to lessen the promotion of new industrial

enterprises in many parts of Canada, business has been so thoroughly satisfactory in the Atlantic Provinces that the slogan "Business as Usual" has no empty sound—it is full of significance and being strictly adhered to. Various industrial concerns have been favored with military contracts, and this has helped sustain general business. The greatest interest now centres in the matter of the spring opening of the lumber trade. Just at present there is concern in different parts as to whether or not the snowfall will be adequate to allow of successful operations for the marketing of the cut. The quantity of snow which has fallen thus far has been fair in northern New Brunswick but along the southern centres it has not been satisfactory. Heavy rains this week may mean the tying-up of large quantities of logs. As the success or failure of the lumbering business generally reflects very much on other branches of industry, the matter is of keen importance to all.

### Trade Notes.

Under the name of Robinson, Ltd., with an authorized capitalization of $99,000, a new lumber company is seeking incorporation at Millerton, N.B. The applicants are James Robinson, Weldon Robinson, Homes A. Frank, Mrs. Susan G. Frank and Grace Robinson of Millerton, and they plan to carry on the business of James Robinson, ex-M.P.

The Portland Rolling Mills at St. John, N.B., have been awarded a large contract for the supply of steel to the Intercolonial Railway. It will keep them busy for some time. T. McAvity & Sons have been given a Government contract for the supply of brass plugs for shells for army use. The Phoenix Foundry, another local concern, has a large order for the manufacture of shrapnel cases.

### Lumberman Dead.

Charles T. White, senior member of the lumbering firm of Chas. T. White & Son, of Sussex, N.B., is dead at his home there, aged 76 years. He was an extensive lumber operator, and had mills at several points.

### New Industry.

The handsome and up-to-date plant of the Atlantic Sugar Refineries, Ltd., in St. John, is now grinding out its daily stock of sugar for wherever a market serves. The machinery installed, and the appliances used, are the most modern of any in Canada, and the plant is the largest of its kind in the Dominion. The capacity of the plant is one hundred and fifty thousand tons yearly.

**Kingston, Ont.**—The Canadian Locomotive Co. has asked its former employees to register at the time office. This is being done so that the management will know how many men there are about the city who will be available at a moment's notice to resume their former occupation.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

## CANADIAN TRADE COMMISSIONERS

**United Kingdom.**

W. L. Griffith, Secretary, 17 Victoria Street, London, S.W., England.

# INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

## Engineering

**Woodstock, Ont.**—Fire on February 26 damaged the factory of the Canadian Morehead Co. to the extent of $25,000.

**Port Dover, Ont.**—The Lake Erie & Northern Railway Co. contemplates building a round house and machine shop here.

**London, Ont.**—The council propose installing electrically-driven pumps at the Springbank pumping station. H. C. Glaubitz is manager of the waterworks department.

**Windsor, Ont.**—R. E. Hart, Flushing, Mich., has purchased site in No. 2 Factory District, and will erect a factory for making scale attachments.

**Hamilton, Ont.**—The Canadian Horse Shoe Co., a branch of the United States Horse Shoe Co., of Erie, Pa., will be incorporated with a capital of $300,000. A site has been purchased and building operations will be commenced shortly on a plant to cost about $150,000. L. A. McIlroy is president and general manager.

**Fredericton, N.B.**—Notice has been given of an application to be made to the Legislative Assembly at its ensuing session, for the passing of an Act to incorporate the St. John River Hydro-Electric Company, to acquire and develop a water power on the St. John River at Pokiok, about 35 miles above Fredericton.

**Welland, Ont.**—The Canada Forge Co. is making extensive additions to its plant, which will be completed in a few weeks. An addition 100 ft. by 100 ft. is being built to the forge shop by the Standard Steel Construction Co. In this will be installed three more hydraulic presses. The Forge Co. has also contracted with the Hydro Commission for 200 additional electrical horse-power.

## Electrical

**Brockville, Ont.**—The hydro-electric line from Prescott to Brockville is nearing completion and work is being rushed on the transformer station.

**Toronto, Ont.**—The construction of a hydro-radial line from Bracebridge through to the Wa Wa Hotel and ultimately extending to the Algonquin Park headquarters, is under consideration. Sir Adam Beck has promised to give the matter every consideration.

**Renfrew, Ont.**—The council having sold their debentures, have decided to proceed with the installation of the new street lighting system without delay.

**Welland, Ont.**—In a report to the council from the local Hydro Commission it was stated that the cost of increasing the transformer capacity from 600 to 1,200 h.p. would mean a capital expenditure of $3,500. The commission has also spent $22,232.78 on plant, being in debt to the Provincial Commission for this amount. The commission, therefore, recommended that the council raise $25,000 by debentures to provide for this amount.

## General Industrial

**Exeter, Ont.**—W. G. Medd is making some improvements to his creamery at Winchelsea.

**Perth, Ont.**—Local industries are working full time on Government orders for military equipment.

**Ottawa, Ont.**—Grant, Holden & Graham are contemplating an addition to their tent and awning factory.

**Sherbrooke, Que.**—Julius Kayser & Co., of New York, makers of silk gloves, etc., have decided to locate here.

**Montreal, Que.**—The Ives Modern Bedstead Co.'s factory was destroyed by fire on Feb. 24. Loss is estimated at $75,000.

**Medicine Hat, Alta.**—It is understood that the Purmal Brick Co. will shortly re-open their plant here and start making brick.

**Lindsay, Ont**—An effort is being made to raise sufficient money to rebuild Horn Bros. woolen factory, destroyed by fire some time ago.

**Toronto, Ont.**—Wickett & Craig's tannery at Cypress Avenue was damaged by fire to the extent of $2,800 on Feb. 18. The loss is covered by insurance.

**Sarnia, Ont.**—The Imperial Oil Co. is planning considerable extension to the works here, including some stills, which will give employment to a large number of men.

**Montreal, Que.**—The Canadian Consolidated Rubber Co. announces that it will make a million-dollar issue of 7 per cent. preferred stock at par immediately. The proceeds of the issue are to be used in enlarging the Berlin tire factory, and also some departments at the Montreal plants.

**Brampton, Ont.**—Henry Abell has leased the Abell Works here to Ed. R. Lewis of Toronto, who intends to open a factory for preparing sheep skins and other leather goods.

**Harriston, Ont.**—The Harriston Furniture Co. and the Harriston Stove Foundry Co., after being shut down for some time, have opened up, and are working a ten-hour day.

**Winnipeg, Man.**—The Canadian Broom Mfg. Co. has been incorporated to manufacture all kinds of brooms and brushes. The head office will be here and the company is capitalized at $20,000.

**Elora, Ont.**—The Elora Textile Co., of which D. F. Stewart is manager, has taken over the S. S. and O. S. Sugden woolen mill at Hawkesville, Ont., and is equipping it to be operated as a spinning plant for the manufacture of hosiery and sweater yarns.

**Brockville, Ont.**— A new industry for Westport shortly will be the manufacture of Victoria Polish, a product made from feldspar. J. M. Stoness & Sons intend installing the machinery to manufacture the polish. The polish is used for cleaning nickel, silverware, kitchen utensils, etc.

**Toronto, Ont.**—It is reported that the Curtiss Aeroplane Co. has rented a factory building from the Steel & Radiation Company, Fraser Avenue, which will be used for the manufacture of aeroplanes. J. D. A. McCurdy, the Canadian aviator, is one of the heads of the Curtiss Co., which has recently been incorporated at Ottawa.

## Municipal

**Paris, Ont.**—The council propose to install two water purification plants.

**Vegreville, Alta.**—The town will build an electric lighting plant. An injunction brought by T. A. Weeks has been dismissed in the Supreme Court of Alberta.

**Kamloops, B.C.**—A by-law is contemplated to raise $35,000 for waterworks and $40,000 for electric lighting purposes.

# MECHANICAL EQUIPMENT REQUIRED FOR NEW CENTRAL TECHNICAL SCHOOL, TORONTO.

The Advisory Industrial Committee of the Board of Education, Toronto, will receive sealed tenders, whole or separate, addressed to the Secretary-Treasurer of the Board, W. C. Wilkinson, on or before Monday, March 8, 1915. for the following items of equipment for the New Central Technical School. Plans and specifications may be seen at the office of the Technical School, 149 College Street, Toronto.

### FORGE SHOP.

20 Anvils.
19 Forges with hand-driven fans.
1 Forge with compressed air injector.
1 Grinder.
1 Shear and punch.
1 Power hammer.
1 Drill.
1 Motor.
4 Pneumatic hammers.
21 Hand hammers.
21 Squares, graduated.
2 Cold chisels, with handles.
2 Hot chisels with handles.
2 Ten-pound sledges.
Dies for power hammer.
2 Vises.
1 Gas furnace with pyrometer.
1 Heating furnace.
1 Swage block mounted.
2 Button sets.
All anvils to be furnished with individual sets of tools and coal boxes.
10 each top and bottom fullers ¾ in. x ½ in.
10 each top and bottom swages, ¾ in. x ½ in.
10 Flatters.
10 1¼ in. set hammers.
2 Round punches—⅜ in.
20 Heading tools—⅜ x ½.

### FOUNDRY

1 Cupola—26 in. shell.
4 Brass furnaces with fire brick linings.
8 Crucibles.
Grating for furnace pit.
Air hose and piping.
3 Air injectors for cupola and brass furnaces.
1 3-ton traveling crane.
1 Pneumatic or electric hoist.
2 Lifting tongs.
1 Chain hoist (fastened to platform.)
2 Molding machines equipped with patterns and stripping plate.
1 Matched plate.
1 Complete stripping plate machine.
1 Pneumatic vibrator.
2 Pneumatic hammers.
1 Tumbling barrel (with extra parts.)
1 Sand blast outfit.
1 Grinder.
1 Pickle tank.
1 Core machine.
1 Core oven.
12 Hand ladles.
1 Crane ladle.
30 Flasks.
20 Snap flasks.
24 Lifting screws.
24 Vent rods.
24 Riddles.
4 Hand bellows.
10 Rawhide mallets.
10 Blow-pipe sprayers.
60 Slicks.
60 Spoons.
20 Gate cutters.
20 Camel hair brushes.
20 Banister brushes.
20 Swabs. 10 Sprue cutters.
40 Bench rammers. 4 Floor rammers.
1 Coke fork. 6 Shovels.
10 Copper swab pots.
2 Sprinkling cans.
12 Small shovels—fire shovels.
1 Lead melting pot.
1 Pneumatic riddle shaker.
3 Bolt sticks. 1 Platform scale.
2 Tapping bars 1 Tapping chisel.
Molding sand. Pails.
Coke bins. Sand troughs.
Wheelbarrows.
Single and double picks.
1 Heavy ball pein hammer.
1 Heavy sledge—20 lbs.

### MACHINE SHOP.

1 Speed lathe—10 in.
1 Precision bench lathe with all milling and gear cutting attachments.
14 Plain engine lathes (special), cone drive, taper attachment, and standard equipment, interchangeable parts, etc.
6 Tool room lathes — with relieving attachments, taper attachment, draw-in chucks and collets—lathes to be of different makes.
1 Metal planer—24 in. x 24 in. x 6 ft., 4 speeds, independent motor and planer vise.
4 Shapers, with vises complete.
2 Universal milling machines complete.
1 Circular milling table.
1 Universal vertical milling head.
1 Profiling head.
2 Plain milling machines.
4 Dividing heads and centres, complete.
1 High speed drill with 12 in. overhang—motor drive.
1 2-Spindle sensitive drill with speed gear box. 1 Semi-automatic.
1 Tool grinder.
1 Drill grinder.
2 Universal grinders motor driven.
2 Plain cylindrical grinders motor driven.
1 Arbor press.
1 Hardening and tempering furnace with pyrometer.
1 30 in. boring mill.
1 16 in., 32 in. extension gap lathe motor driven.
1 Die slotter.
1 Punch press.
Pulleys, silent chain drives, shafting, belting, etc.

### WOODWORKING MACHINERY.

24 Cone driven wood turning lathes, 14 in. swing.
1 Wood turning lathe with compound rest 20 in.
4 Water tool grinders.
3 Band saws, 36 in.
2 Disc and spindle sanders.
1 Universal saw table.
1 Self-feed rip saw.
1 Table cut-off saw.
3 Variety saws.
2 Bench jointers
1 12 in. jointer.
1 16 in. jointer.
1 30 in. surfacer.
1 Mortising and tenoning machine.
2 Hollow chisel mortisers.
1 Tenoner with double cope heads and cut off saws.
1 Double spindle shaper.
1 Pneumatic sander.
1 Belt sander.
1 Boring, routing, and sanding machine.
1 Veneer press.
1 Saw vise.
1 Knife balancer.
1 Fan dust collector, separator and tank
1 Saw grinder.
1 portable wood worker.
All machines direct motor driven except cone driven lathes.

### TESTING MACHINES.

1 Cement tester.
1 Standard screw power testing machine with power drive and completely equipped for round, flat, and square specimens for tensile, compression and transverse tests. also extensometer, compressometer and transverse indicator.
1 Hydraulic compression testing machine for brick, stone and cement, with two gauges.
Weigh scale, moist chamber, gilmour needles and 50 moulds.

### STEAM ENGINE LABORATORY.

1 Plain slide valve steam engine with special eccentric fastenings for valve setting adjustments—20 25-h.p.
1 Automatic engine with inertia governor and adjustable fly wheel for valve setting adjustments—20-25 h.p.
1 Gas engine with governor adjustable for speed regulation.
1 Steam turbine with dynamometer or direct connected dynamo.
1 Surface condenser.
6 Thermometers for steam and water.
3 Steam calorimeters.
1 Coal calorimeter.
2 Steam gauges.
2 Vacuum gauges.
1 Gauge tester.
4 Indicators with reducing motions.
2 Planimeters.
All engines and machines to be fitted with water and drain pipes, hollow pulleys, prony brakes, piping, bends, valves, fittings, thermometer wells, calorimeter connections, indicator connections, gauge connections, etc., complete.

### ELECTRICAL APPARATUS.

2 Motor generator sets—2 115 or 230 volt interpole D.C. motors direct connected on base plates to 2 compound wound generators to deliver 200 amps. at 6 volts. All complete with field rheostats, starting boxes, no voltage release, no switches.
Above to be guaranteed for a rise not over 40 deg. C. in temperature.
3 Transformers 1 K.W. from 110 volts and 220 volts to 1100 and 2200 volts, 60 cycles.
1 Rotary converter, 125 volts, 40 amps. on D.C. end, or about 5 K.W. for 60 cycles.
1 Motor generator set 20 h.p. 220 volt, interpole motor running just under 1000 r.p.m. direct connected to generator on same base plate by approved coupling for 110 volts, 60 cycle, A.C. current when running at 1200 r.p.m. To have six pole rotating field and rheostats to give large number of steps and overload release.
1 Motor generator set, 10 h.p. motor and 7½ K.W. generator, equipped with solid base plate, rheostats, starting boxes, etc.
1 Testing transformer, 10000 v. ½ K.W
1 Series motor, D.C. 110 v. or 220 v. about 3¼ h.p., 825 r.p.m.
2 Interpole motors, D.C., 110 v. 5 h.p., about 1350 r.p.m.
2 Compound wound generators. D.C. 125 v., 3 or 4 K.W., with field rheostat with a large number of steps, approved couplings, base plates, starting boxes, overload circuit breakers, etc.
6 Interpole motors, 4 or 5 h.p. at about 1200 r.p.m. or under, for 115 v. D.C. or 230 v. D.C. with switches, starting boxes, voltage release, circuit breakers, etc.
2 Interpole motors, 7½ h.p. (same as above except speed).
3 10 h.p. interpole motors (same as above except speed).
1 15 h.p. interpole motor (same as above except speed).
3 Spare armatures and circuit breakers.
These motors to be in addition to those called for on individual drive machines, and all provided with hollow pulleys for breaks.

# Trade Gossip

**Orillia, Ont.**—At a meeting of the Board of Trade the following officers were elected: President, M. B. Tudhope; vice-president, Frank S. Lewis; treasurer, Nelson Ball; secretary, Harold L. Kearns.

**Ottawa, Ont.**—It is stated here that an order for a million shells is being placed in Canada by the Russian Government following the visit to Petrograd of Senator Curry, head of the Canadian Steel Foundries, Ltd.

**Sudbury, Ont.**—The Board of Trade have elected the following officers: President, D. M. Brodie; P. Gorman, vice-president; Percy Morrison, secretary; council, Messrs. Peacock, Stafford, Beath, Evans, Henry, Duncan, Rieard, Moyle, McArthur, Mitchell, Seybold.

**Orillia, Ont.**—J. B. Tudhope, president of the Tudhope-Anderson Co., announces that F. S. Lewis, who has for some time been director of the company, has been elected vice-president and managing director. The other officers will remain as at present. These are: H. F. Anderson, general manager; Geo. E. Peacock, manager manufacturing department; R. S. Harder, eastern sales manager.

**Canadian National Exhibition Executive.**—Joseph Oliver was re-elected president of the Canadian National Exhibition at the inaugural meeting of the Board of Directors held in Toronto on March 1. The other officers are: Honorary President, John G. Kent; first vice-president, Noel Marshall; second vice-president, George Booth. Executive Committee—The officers and W. K. McNaught, Geo. H. Gooderham, W. K. George, Alderman McBride, Robt. Fleming, and T. A. Russell.

**Sherbrooke, Que.**—The annual meeting of the Board of Trade was held on Feb. 9, and the election of officers for the ensuing year resulted as follows: President, J. E. Poutrie; vice-president, D. J. Steele; councillors, Messrs. C. W. Cate, C. Beauchesne, E. W. Farwell, L. E. Chamberlain, V. E. Morrill, F. H. Hebert, E. J. Page, F. R. Darche, A. C. Skinner, G. H. St. Pierre, A. M. Sangster, J. O. Darche, J. W. McKee, A. U. Dorais, H. V. Haight, J. O'C. Migneault, F. H. Bradley, Gustave Richard, M. Echenberg, A. G. Sabourin.

**Metal Manufacturers' Association.**—The machinery and metal manufacturers of Ontario may form themselves into an association to reduce the risk of accidents in their factories and thus eventually reduce their assessments under the Workmen's Compensation Act. This association may select J. D. Thorne as chairman when it is formed. Other manufacturers are taking like steps for the purpose of reducing the number of accidents and thereby gaining lighter assessments.

**Montreal, Que.**—A meeting of the Toronto Terminal Co. was held here on Feb. 22, with H. G. Kelley, vice-president of the Grand Trunk, in the chair. There were also present Sir Thomas Shaughnessy, G. S. Bury, I. G. Ogden and Henry Phillips, secretary. The company, which represents the C. P. R. and Grand Trunk in the building of a new Union Station and viaduct at Toronto, is to issue special bonds to bring in something like $15,000,000, which sum it is understood will about cover the cost of the entire work.

**Canada Machinery Corporation.**—At a special meeting of the bondholders of the Canada Machinery Corporation, held at the head office, Galt, Ont., on February 18, and presided over by T. Gibson, of Toronto, the sale of the Hamilton property was authorized. This action, according to T. H. Watson, president and general manager, meant a concentration of the business at Galt and extensions to the plant there. The meeting also carried a resolution converting 50 per cent. of the bond issue into preferred stock and deferred the interest for two years.

**ALLIES PURCHASING AGENTS.**

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**British—Col. A. G. Barton and A. C. Billing, Ritz Carlton Hotel, Montreal.**

**French—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.**

**Russian—Messrs. S. Ruperti and Aiekieff, care Military Attache, Russian Embassy, Washington, D.C.**

**Cornwall, Ont.**—At the annual meeting of the Board of Trade the following officers were elected: President, C. H. Cline; vice-president, A. E. Currie; secretary, R. Dodd; treasurer, E. O'Callaghan; auditors, J. A. Chisholm, J. C. Alguire; councillors, P. E. Campbell, W. V. Boyd, J. C. Alguire, A. McCracken, J. E. Snetsinger, J. A. Chisholm, G. R. Phillips, N. J. Fraid, W. Hodge, G. A. Stiles, W. Gibbens, Dr. W. B. Cavanagh. It was decided to enter upon a vigorous publicity campaign, to secure some of the industries that will undoubtedly be established in Canada upon the cessation of the war. The board will act in conjunction with the Town Council, and the advantages of Cornwall will be extensively advertised in Canada and the United States.

**Machinists' Ball.**—The fifth annual ball given by the St. Thomas machinists in the engineers' hall on Feb. 15 was the most successful yet held. Over 600 guests were present and the hall was decorated in a fitting manner with patriotic colors, flags, etc. The music, furnished by Finzel's orchestra of Detroit, was of the highest order, and the selections were much appreciated by the dancers. At midnight a delightful and substantial lunch was served to which all did justice, testifying thereby to the goodness of the delicacies served. The committee who had charge of the ball, and who were responsible for its success were: Geo. Richardson, chairman; H. A. Vieary, secretary-treasurer; J. W. Boath, A. Buchan, J. Lane, J. Alexander, C. J. Rowley, H. Manning and R. Logan.

**Transport Wagon Contracts.**—Transport wagons to the number of 894 were purchased for the Canadian troops, according to a return brought down in the House of Commons on Feb. 23. The prices paid were $140 for heavy and $120 for light wagons. The heavy wagons were purchased from the American Road Machinery Co., Goderich, 60; Port Arthur Wagon Co., 45; International Harvester Co., Chatham, 50; Adams Wagon Co., Brantford, 37; Tudhope, Anderson Co., Orillia, 10; Smith Bros., Toronto, 50; Elsear Dore, La Prairie, 38; Metallurgic Enterprise Co., Sorel, 51. Light wagons were purchased as follows: Speight Wagon Co., Markham, 50; Petrolea Wagon Co., 80; Adams Wagon Co., Brantford, 30; American Road Machinery Co., 50; Woodstock Wagon Co., 67. Tenders were invited verbally.

**Trucks Purchased by Government.**—A return tabled on Feb. 25 in Parliament regarding the purchase of motor trucks for the first contingent shows that the number was 142, purchased as follows: Twenty-three from the Gramm Motor Truck Co., Walkerville, Ont., the makers; forty-three from the White Co., Toronto, made by the White Co., Cleveland, Ohio; twenty-five from Dominion Automobile Co., Toronto, made by the Peerless Motor Co., Cleveland, Ohio; twenty-six from the Russel Motor Car Co., Toronto, made by Jeffrey Co., Kenosha, Wis.; twenty-five from Russell Motor Car Co., made by Kelly, Springfield, Motor Truck Co., Springfield, Ohio. Of trucks with a 3½-ton capacity, 15 were built by the Gramm Co., and 25 by the Kelly, Springfield. The White Co.

Canada's Leading Machinery House

## HOLDEN-MORGAN'S
# Shell Marking Machine

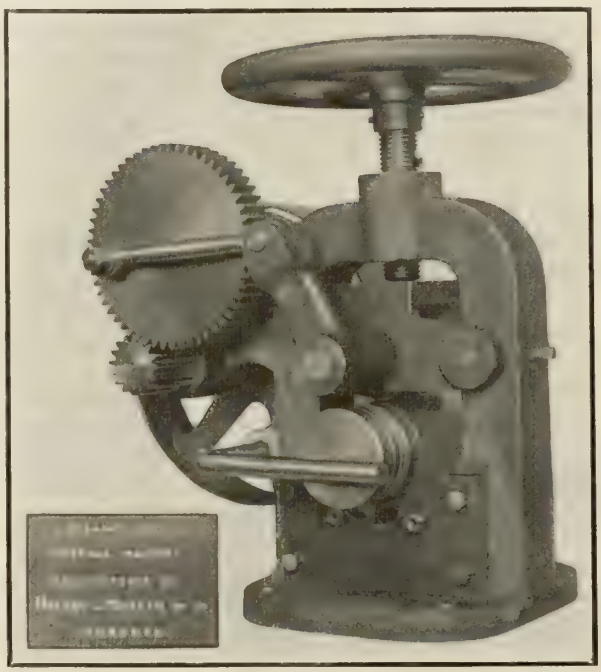
Compact and accurate, does not require skilled labor, gives proper depth of impression and will not distort shell. Takes care of variation in diameter. Marks shell in 5 to 10 seconds.

Price $135.00 F.O.B. Toronto.
Delivery 10 days to 2 weeks.

Price includes marking wheel with the following letters:

**Q. F. 18 Pr.**
**III**
**F.S.**
**(MAKER'S INITIALS)**
**DATE, NO. OF MONTH, YEAR**

Two sets of figures included—0-12 and 1-9, marking month and date—for series No. 2, sets letters cost $6.50 per set extra. Additional figures $3.00 per set (figures and letters can be changed in about five minutes.) Largest shell manufacturers now using this machine. Mail us your order.



## WE OFFER YOU ANOTHER TIME-SAVER—

# The Hamilton Double-Ended Facing and Cutting-off Machine

Cuts off open end of shells and faces closed end in one minute to one minute and one-half; **"one chucking"** shell is located from stop on inside of base or powder chamber.

Special six cam chuck, positive grip. Jaws of tool steel and operate in tool steel bearings.

Spur gears are of steel with exception of large gear. All gears guarded, completely enclosed and well lubricated. Geared pump, with reservoir in base of machine, supplies liberal amount of fluid to each cutter.

Automatic stop with four to one return.

Standard high-speed steel bars. No specially forged tools.

**Send us your order. This is a real time-saver and a well-made machine. Price $450.00 f.o.b. Toronto—Delivery two weeks.**

**We also supply complete set of gauges and other special equipment.**

**MACHINE TOOL DEPARTMENT**

**The A. R. Williams Machinery Co. Ltd., 64-66 Front St. W., Toronto**

built 38, and the Peerless 25 trucks of 3-ton capacity, while two-ton trucks were built, 26 by the Jeffrey Co., 8 by the Gramm and 5 by the White Co. The prices paid were: Gramm, 3½-tons, $4,140; Gramm, 2 tons, $3,240; White, 3-tons, $3,330; White, 2-tons, $2,700; Peerless, 3-tons, $3,330; Jeffrey, 2-tons, $2,470; Kelly, Springfield, 3½-tons, $3,105.

## Personal

**Hamilton, Ont.**—The mayor will receive applications for the position of principal assistant engineer up to March 3.

**Osgood McVean**, senior member of the firm of O. & W. McVean, wheel manufacturers of Dresden, Ont., died there on Feb. 26.

**F. Orr-Lewis**, president Lewis Bros. and Can. Vickers, Ltd., Montreal, returned home last week, via New York, on the "Lusitania," from the Old Country.

**C. S. Griffith**, who has been representing the Queen City Oil Co. in the St. Thomas district, has been appointed manager of the Imperial Oil Co.'s business at Ottawa, and has left for that place.

**Captain John McMulkin**, for many years one of the best known St. John river steamer captains, for ten years an alderman in St. John, and New Brunswick's first factory inspector, died on Feb. 24, aged 79 years.

**Richard Schofield**, member of the Toronto firm of Schofield-Holden, machinery manufacturers, died on Feb. 26, at San Francisco, as the result of an operation for appendicitis. Mr. Schofield was in his fifty-ninth year, and leaves a widow, a son and daughter.

**Frank Edward Norton**, manager of the Norton Telephone Manufacturing Co., died on Feb. 19 at St. Michael's Hospital, Toronto. Mr. Norton was born 50 years ago at Fort Covington, N.Y., and had been engaged in the telephone business at Halifax and Montreal before coming to Toronto ten years ago.

**Fred M. Hoadley**, consulting engineer, 802 New Birks Building, Montreal, has been commissioned by the Bishop of the monastery at Oka, Quebec, to make a complete investigation into the possibilities of developing a hydro-electric plant upon the river running through the property adjacent to the monastery.

**William Newman**, naval architect of the Polson Iron Works, Toronto, has been awarded a commission with the rank of lieutenant in the 23rd Regiment Northern Pioneers, Owen Sound, his home town. He was formerly a non-commissioned officer in the 48th Highlanders and the 14th Princess of Wales' Own Rifles, Kingston.

**John Oliver Parker**, head of the J. O. Parker & Co. brass works, died on Feb. 27 at his residence, 162 Garden avenue, Toronto, aged 67 years. Mr. Parker was born at Birmingham, England, and came to Toronto when a young man. Practically all his life he was engaged in the brass business, and retired only a short time ago.

**E. M. Breed**, who for the past eight years has been district manager of the Canadian Allis-Chalmers, Ltd., with headquarters at Vancouver, B.C., has been appointed district manager of the Pelton Water Wheel Co. He will continue his headquarters at Vancouver. Mr. Breed is a graduate of the University of Maine, college of technology, and is a member of the American Institute of Electrical Engineers. Previous to becoming manager for the Canadian Allis-Chalmers Co. he was with the sales force of the Canadian Westinghouse Co., at Montreal.

## Tenders

**Toronto, Ont.**—Tenders for transformers, addressed to the Chairman, Toronto Electric Commissioners, will be received until March 11, 1915. Specifications and form of tender may be obtained at the office of the Purchasing Agent.

**Winnipeg, Man.**—Tenders addressed to the Chairman, Board of Control, will be received up to Monday, March 22, 1915, for the supply of storage batteries for the new Central Fire Alarm Office equipment. Specifications may be obtained at the office of the City Electrician, Olafsen Block, Winnipeg. M. Peterson, Secretary.

**Toronto, Ont.**—Tenders will be received by the chairman of the Board of Control, City Hall, up to Tuesday, April 13, 1915, for the supply of automatic valves and check valves. Specifications and tender form for the foregoing may be obtained upon application at Room 12, Purchasing and Accounting Section, of the Department of Works, City Hall.

**Port Hope, Ont.**—Tenders will be received by the secretary of the Board of Water Commissioners until March 15 for the following work and materials:—Contract 3—Low-lift centrifugal pumps, motors, oil engine, piping and erection of same. 4—Venturi tubes, loss of head gauges, elevation gauges. 5—The construction of four slow sand filters, pump house and pure water reservoir. 6—Cast iron pipe and specials. 7—Valves and valve boxes. Plans may be seen and specifications obtained at the office of the engineers, F. W. Thorold Co., Ltd., 2 Toronto Street, Toronto, Ont.

**St. Catharines, Ont.**—Tenders will be received by the architect until Monday, March 15, 1915, for all trades required for the erection and completion of a new Collegiate Institute to be erected in St. Catharines, Ont. A complete set of plans and specifications may be seen at any reasonable time at the office of the architect, 46 Queen Street, St. Catharines, Ont. Contractors wishing to obtain a set of plans and specifications for estimating may do so upon application to the architect and depositing with him a marked cheque for $25.00. A. E. Nicholson, O.A.A., architect, St. Catharines, Ont.

**Fredericton, N.B.**—Tenders will be received at the Department of Public Works, Fredericton, until March 31, 1915, for constructing the steel superstructure of a new bridge, to take the place of the present wooden highway bridge at Moncton over the Petitcodiac River; one through fixed riveted steel truss span of 355 feet from centre to centre of end bearings; four through fixed riveted steel truss spans of 261 ft., 6 in. from centre to centre of end bearings, according to plans and specifications to be seen at the Public Works Department, Fredericton, N.B. John Morrissy, Minister of Public Works.

**Toronto, Ont.**—The Advisory Industrial Committee of the Board of Education will receive tenders, whole or separate, addressed to the secretary-treasurer of the Board, on or before Monday, March 8, 1915, for the following:

(1)—Special electric fixtures.

(2)—Tile and plaster work in engine-room.

(3)—Electric Fixtures for all classrooms and corridors.

(4)—Lavatory Switchboards.

(5)—Exhaust Fan for Forges.

(6)—Furniture and Equipment, including: Classroom Desks and Chairs; Laboratory and Shop Benches; Cases and Fittings; Office, Auditorium and Lecture-room Furniture; Science Equipment; Steel Lockers; Printing Material and Presses; Woodworking Lathes; Machine Lathes; Foundry, Forge and Machine Shop Equipment; Blinds, Curtains, Ranges; Laundry Equipment, etc.

Plans and specifications may be seen for items Nos. 1 and 2 at the offices of the architects, Ross & McDonald, 828 Traders' Bank Building; for items Nos. 3, 4 and 5, at the offices of the engineers, Canadian Domestic Engineering Co., 47-51 King street west; and for item No. 6, at the office of the Technical School, 149 College street. W. C. Wilkinson, Secretary-treasurer.

**Ottawa, Ont.**—Tenders will be received until Thursday, March 18, 1915, for the construction of the superstructures of two (2) steel through truss highway bridges and of one (1) steel single leaf highway Strauss Trunnion Bascule bridge over the Cataraqui River at Kingston, Ont. Plans and forms of contract can be seen and specification and forms of tender obtained at the Department of Public Works, Ottawa, and at the offices of the District Engineers, Confederation Life Building, Toronto, Ont.; Shaughnessy Building, Montreal, Que., and on application to the Postmasters at Hamilton, Ont., and Kingston, Ont.

## Contracts Awarded

**The Kerr Engine Works,** Walkerville, Ont., have been awarded a contract for a number of valves by the City of Fort William, Ont.

**The A. B. See Electric Elevator Co.,** Montreal, has been awarded a contract for installing an electric freight elevator by the Department of Public Works, Ottawa.

**Berlin, Ont.**—The L. McBrine Co. has received an order for 1,500 sets of artillery harness. The company is also working on an order for saddles for the Russian Government.

FOR SALE

Plant Suitable for Manufacture of War Munitions

The Large Plant of the **Berg Machinery Manufacturing Company, Limited,** situate near the centre of Toronto's water front, and covering about two acres, with suitable buildings and railway siding thereon. The Plant consists of **Machine, Boiler, Foundry, Blacksmith** and **Pattern** Shops, and is adapted for the manufacture of war munitions.

For particulars apply to

## Genuine Armstrong Stocks and Dies

**Hinged Pipe Vises.**

**Pipe Cutters. Steam and Gas Fitters' Tools.**

**Pipe Machines for Threading Pipe.**

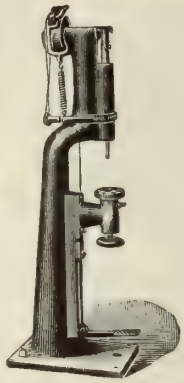
**Either Hand or Power.**

*Manufactured by*

**THE ARMSTRONG M'F'G CO.**

328 KNOWLTON ST. BRIDGEPORT, CONN.

NEW YORK, 248 CANAL ST.



## Light and Heavy Riveting

can be done equally well on our ELASTIC ROTARY BLOW RIVETING MACHINE because the force of the blow is always under the control of the operator, and quickly adjusted to suit the work.

The machine is made in several sizes and styles, and every head is perfectly formed, any shape you wish.

**Catalogue?**

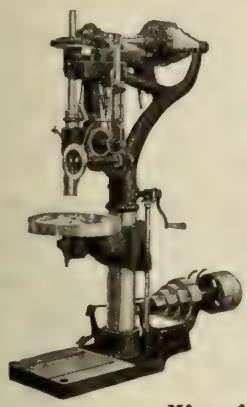
**The F. B. SHUSTER COMPANY**

**New Haven, Conn.**

Formerly John Adt & Son. Established 1866

Also makers of Wire Straighteners, for rounds, squares, hexagons, etc.

Canadian Agents: A. R. Williams Machinery Co., Toronto.



## Our 23" Mechanic's Drill

has features with which you may not be familiar.

There are eight speeds provided, with quick advance and return.

Stationary Head and Back geared with automatic stop. This drill can be motor-driven and will drive high-speed drills to their utmost capacity. The quality is the same as all "Rockford" quality—the best.

# CLUTCHES

**Combined Jaw and Friction. Friction only Gas Engine Clutches. Jaw Clutches.**

Write for interesting printed matter.

**The Positive Clutch & Pulley Works Ltd.**

MONTREAL Factory: Aurora, Ont. TORONTO

**20 TIMES THE SERVICE**

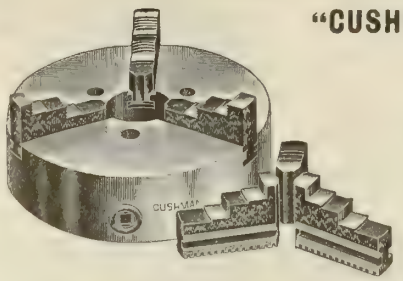
That's what this self-hardening, high-speed steel chaser does for the LANDIS DIE. Four long cutters tangentially disposed to the work carried in suitable holders make an ideal cutting condition. This, along with its many other distinctive characteristics, has established for us a world-wide reputation.

WRITE FOR CATALOGUE NO. 21.

**Landis Machine Co., Waynesboro, Pa.**

Exclusive Canadian Representatives, Williams & Wilson, Montreal, Canada.

**"CUSHMAN" CHUCKS**



are generally known as the "heavy pattern," being designed for hard service.

Their accuracy and reliability have been proven over and over again, and the name "Cushman" on your chuck is a guarantee of satisfaction.

Our line consists of many styles and sizes of Lathe Chucks, Drill Chucks, Centering Chucks, and Face-Plate Jaws.

Catalogue Free.

**THE CUSHMAN CHUCK CO.**

Hartford, Established 1862 Conn., U.S.A.

**The Machines that put the "rings" in Springs !**

Springs like this are produced automatically, and without tool charge, on our Coilers.

# Who Pays For Advertising?

SOME reminiscences of the late Thomas J. Barratt, who made Pear's soap famous through advertising, and who helped to make advertising famous through Pear's soap, appear in the "Strand" Magazine for March.

Mr. Barratt was the best known advertising man of his time, and spent millions in promoting the sale of Pear's soap through advertising.

The famous "Bubbles" picture, by Sir John Millais for instance, cost £2,200 (nearly $11,000) and hundreds of thousands of pounds have been spent in reproducing it in countless forms.

A good-sized fortune was spent in space in American publications in order to show Henry Ward Beecher's testimonial letter, secured under such unusual circumstances.

The article throws many interesting sidelights on the life of Mr. Barratt, and his achievements in the business world. Let us quote his answer to the question "Who pays the cost of advertising"?

> "Certainly not the consumer, certainly not the retailer. Here is the real truth of the matter. Money wisely spent in advertising increases sales and profits to such an extent that sufficient capital is provided for the operation of economies naturally resulting from buying and manufacturing in larger quantities. The bigger the volume of trade, the cheaper is the relative production; in fact, as all leading advertisers know, production is cheapened in a much greater degree by advertising than is represented by the money spent in advertising.
>
> "Much as we advertisers love the newspapers, to whose revenue we contribute so handsomely, we only perform this service because we get more out of the publicity they give us than they get out of us—with occasional exceptions perhaps, which are soon rectified. But what is of still greater importance is that, in ratio with the cheapening of production, there is a cheapening of the advertised article to the public."

This answer applies to-day just as well as when Mr. Barratt made it.

And it applies to machine tools as well as soap. It applies to technical journals as well as newspapers.

If anything, the answer carries added emphasis to-day because the standard of advertising is higher, and is being carefully guarded by the sentries of Vigilance Committees and other Protective Associations.

In short, it pays to buy advertised goods BECAUSE THEY ARE ADVERTISED.

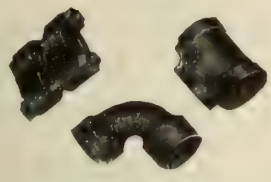
# How do You Order Hydraulic Valves and Fittings?

**Do you simply specify "Necessary Pipe, Valves and Fittings" or are you particular what *Quality* you get?**

**Kromax Leather Packings**

**are guaranteed to outlast under similar conditions any competitive packing on the market.**



**Hydraulic Fittings.**

Will it interest you to know that every piece of pipe, every valve, elbow, tee or other hydraulic fitting is carefully tested before shipping and is guaranteed to stand a safe overload?

These tests insure you against **accident, loss of time** and **production.**

In our 60 years' experience building hydraulic machinery we have eliminated mistakes and evolved a line of hydraulic operating, check, stop and shock relief valves that covers an almost endless number of combinations to meet the varied demands of hydraulic systems.

**Phantom View Style "D" Die Head.**

## Twenty-five Die Heads Thrown Out of One Factory and Replaced With Geometric Die Heads!

Does not this prove that **THE GEOMETRIC** is King?

Perfected in all its working parts, you will find the Geometric in good live shops, on Hand and Automatic Screw Machines.

Every Screw Machine Manufacturer recommends and furnishes the Geometric as a part of the tool equipment.

For cutting any diameter, length or pitch of thread.

When the required length has been threaded, the dies open automatically, and are withdrawn without touching the thread.

**No Waste of Time or Material.** **Send for Our Catalogue.**

Canadian Ingersoll-Rand Co., Ltd., Montreal.
Durtis Pneumatic Machinery Co., St. Louis, Mo.
Northern Crane Works, Walkerville.
Tallman Brass & Metal Co., Hamilton

**Traveling Cranes.**
Herbert Morris Crane & Hoist Co., Ltd., Toronto.
Northern Crane Works, Walkerville.
Smart-Turner Machine Co., Hamilton, Ont.
Whiting Foundry Equipment Co., Harvey, Ill.

**Trolley Hoists, Electric.**
Herbert Morris Crane & Hoist Co., Ltd., Toronto.
Northern Crane Works, Walkerville.
Whiting Foundry Equipment Co., Harvey, Ill.

**Turnbuckles.**
Canadian Billings & Spencer, Ltd., Welland.
Can. H. W. Johns-Manville Co., Ltd., Toronto.

**Turret Machines.**
Pratt & Whitney, Hartford, Conn.

**Turbines, Steam, Water.**
John Inglis Co., Toronto.
Plessisville Foundry, Plessisville, Que.
Can. Westinghouse Co., Hamilton.

**Twine and Cordage.**
Scythes & Co., Ltd., Toronto.

**Upsetting and Bending Machinery.**
A. R. Williams Machy. Co., Toronto
John Bertram & Sons Co., Dundas.
Brown, Boggs Co., Ltd., Hamilton, Canada.
A. B. Jardine & Co., Hespeler.
National Machy. Co., Tiffin, O.
Niles-Bement-Pond Co. New York.
Watson-Stillman Co., Aldene, N.J.

WHEN you need new equipment or supplies for your machine shop

**Consult this Directory**

¶ You'll find listed here the reliable makers of the lines you need; firms who believe in the progressiveness of present-day manufacturers and who appeal to their intelligence through their own engineering journal.

¶ Consult Canadian Machinery Buyers' Directory and you can't go wrong in your buying.

**Trucks, Lumber and Kiln.**
John Inglis Co., Toronto.
Sheldons, Ltd., Galt, Ont.
Herbert Morris Crane & Hoist Co. Ltd., Toronto.
Northern Crane Works, Walkerville

**Trucks, Factory, Freight, Etc.**
Herbert Morris Crane & Hoist Co., Ltd., Toronto.
Whiting Foundry Equipment Co., Harvey, Ill.

**Trucks, Steel Barrel.**
Canadian Steel Products Company, Montreal.

**Tube Expanders (Rollers).**
A. B. Jardine & Co., Hespeler.
Watson-Stillman Co., Aldene, N.J.

**Tumbling Barrels.**
Baird Machine Co., Bridgeport, Conn.
Northern Crane Works, Walkerville.
Whiting Foundry Equipment Co., Harvey, Ill.

**Vacuum Pumps.**
John Inglis Co., Toronto.
Smart-Turner Machine Co., Hamilton, Ont.

**Valve Grinders (Pneumatic).**
Cleveland Pneumatic Tool Co. of Canada, Toronto.

**Valves, Hydraulic.**
Watson-Stillman Co., Aldene, N.J.

**Valve Leathers.**
Graton & Knight Mfg. Co., Montreal.

**Valve Milling Machines.**
Barkey Bros., Stoutsville, Ont.

**Valves, Back Pressure, Steam.**
Sheldons, Limited, Galt.

**Ventilating Apparatus.**
Can. Sirocco Co., Ltd., Windsor, Ont.
A. R. Williams Machy. Co., Toronto.
Sheldons, Limited, Galt.

**Vises, Bench.**
Emmert Mfg. Co., Waynesboro, Pt.
Hollands Mfg. Co., Erie, Pa.
National Mach. & Sup. Co., Hamilton.

**Vises, Pipe.**
Armstrong Mfg. Company, Bridgeport, Conn.
Emmert Mfg. Co., Waynesboro, Pt.
National Mach. & Sup. Co., Hamilton.

**Vises, Planer and Shaper.**
National Mach. & Sup. Co., Hamilton.
Skinner Chuck Co., New Britain, C.

**Vises, Milling Machine.**
National Mach. & Sup. Co., Hamilton.

**Vises, Woodworking.**
Emmert Mfg. Co., Waynesboro, Pt.

**Washers.**
London Bolt & Hinge Works, London, Ont.

**Washer Machines.**
National Machy. Co., Tiffin, Ohio.

**Waste and Wipes.**
Scythes & Co., Ltd., Toronto.

**Waterproof Coating, Cement, Fabric.**
Can. H. W. Johns-Manville Co., Ltd., Toronto.

**Watchman's Clocks.**
A. R. Williams Machy. Co., Toronto.

**Welding and Cutting Clamps.**
L'Air Liquide Society, Toronto.

**Welding and Cutting Work.**
Can. Blauges Co., Montreal.
L'Air Liquide Society, Toronto.
Metals Welding Co., Cleveland, O

**Welding, Autogenous.**
L'Air Liquide Society, Toronto.

**Welding, Acetylene and Oxygen.**
L'Air Liquide Society, Toronto.
Metals Welding Co., Cleveland, O.

**Welding Machines, Electric, etc.**
Tabor Mfg. Co., Philadelphia, Pa.

**Winches.**
John H. Hall & Sons, Brantford.
Herbert Morris Crane & Hoist Co., Ltd., Toronto.
Northern Crane Works, Walkerville.

**Window Wire Guards.**
Canada Wire & Iron Goods Co., Hamilton.

**Wire Cloth and Perforated Metals.**
Canada Wire & Iron Goods Co., Hamilton.
Dennis Wire & Iron Works Co., Ltd., London.

**Wire Forming and Stamping Machinery.**
Brown, Boggs Co., Ltd., Hamilton, Canada.
F. B. Shuster Co., New Haven, Conn.
Baird Machine Co., Bridgeport, Conn.
Sleeper & Hartley, Inc., Worcester, Mass.

**Wire Coiling and Wire Pointing Machinery.**
Sleeper & Hartley, Inc., Worcester, Mass.

**Wire Guards and Railings.**
Canada Wire & Iron Goods Co., Hamilton, Ont.

**Wire Nails.**
Parmenter & Bulloch Co., Gananoque.

**Wire Nail Machinery.**
National Machy. Co., Tiffin, Ohio.
Sleeper & Hartley, Worcester, Mass.
A. R. Williams Machy. Co., Toronto

**Wire Straighteners and Cutters.**
Baird Machine Co., Bridgeport, Conn.
Brown, Boggs Co., Ltd., Hamilton, Canada.
F. B. Shuster Co., New Haven, Conn.

**Wire Coiling and Pointing Machines.**
Baird Machine Co., Bridgeport, Conn.
F. B. Shuster Co., New Haven, Conn.

**Wood Boring Machines.**
Cleveland Pneumatic Tool Co. of Canada, Toronto.
Independent Pneumatic Tool Co., Chicago, Ill.

**Woodworking Machinery.**
A. R. Williams Machy. Co., Toronto
Can. Fairbanks-Morse Co., Montreal.
Plessisville Foundry, Plessisville, Que

**Wrenches.**
Butterfield & Co., Rock Island, Que.
Canadian Billings & Spencer, Ltd., Welland.
Wells Bros. Co., Greenfield, Mass.

**Wrenches, Automobile Narrow Jaw and Monkey.**
Bemis & Call Hardware & Tool Co., Springfield, Mass.
Trimont Mfg. Co., Roxbury, Mass.

**Wrenches, Pipe, Monkey.**
Bemis & Call Hardware & Tool Co., Springfield, Mass.
Trimont Mfg. Co., Roxbury, Mass.

**Wrenches, Ratchet and Basin.**
Bemis & Call Hardware & Tool Co., Springfield, Mass.

# CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS--Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5.00 per line a year is charged to non-advertisers.

**Air Compressors.**
A. R. Williams Machy. Co., Toronto.
Berkshire Mfg. Co., Cleveland, O.
Cleveland Pneumatic Tool Co. of Canada, Toronto.
Canadian Ingersoll-Rand Co., Ltd., Montreal.

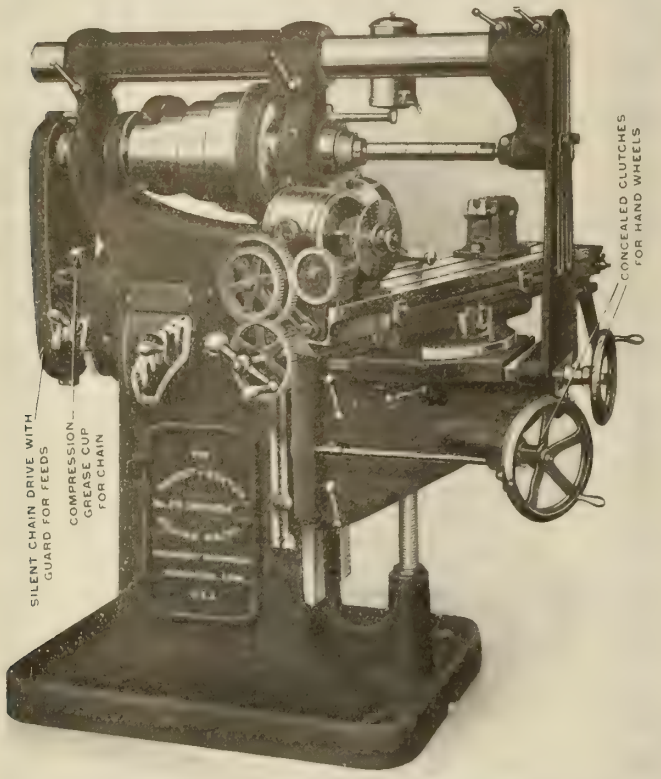
# No. 2B UNIVERSAL MILLING MACHINE



## Sets a new high-mark for efficiency and economy

Main Spindle has taper journals which run in annular bearings.

Constant lubrication is assured by ring oilers which revolve with spindle and pump oil from reservoirs underneath bearings.

Thrust is taken on front bearing, and journals have independent adjustment in either bearing.

Feed Shaft is driven from spindle by heavy silent chain protected with complete guard, supplied with compression grease cup for lubricating chain and sprockets.

All Feeds positive driven through gearing, giving 18 changes.

Automatic Feeds can be operated simultaneously and reversed while machine is in motion.

Feed Gearing is Hardened and feeds have independent controls.

Vertical and Cross Feed Hand Wheels have concealed clutches in hubs which allow wheels to run free on shaft when not employed.

Dividing Head is cylindrical in pattern. Supporting Block for Spindle is carried by side plates which recess into block and have annular bearings in ring of main frame.

Vol. XIII | Publication Office: Toronto, March 11, 1915 | No. 10

# Cowan Transveyor
## Transporting Shrapnel Shells

The Illustration shows a Transveyor transporting shells from the Artillery Shop to the Shrapnel Shop, where they are to be reamed out to exact size. In each skid load there are 180 3" cases, weighing 6 lbs. each. One man, with the Cowan Transveyor, easily handles this 1,080-lb. load with no lost motions and a great saving of time.

**The Cowan Trucking System will do as much to revolutionize within-the-factory trucking as the big Krupp guns have done to the methods of modern warfare.**

## Price and Style Range Covers Entire Field

Cowan Transveyors are made in 5 styles and 6 sizes. Prices range from $92 to $2,400. Throughout the entire field of manufacture there is hardly a business to which the Cowan Trucking System cannot be adapted. Its use is always accompanied by a triple alliance of savings—time, labor and floor space.

**Write for price list and specification chart.**

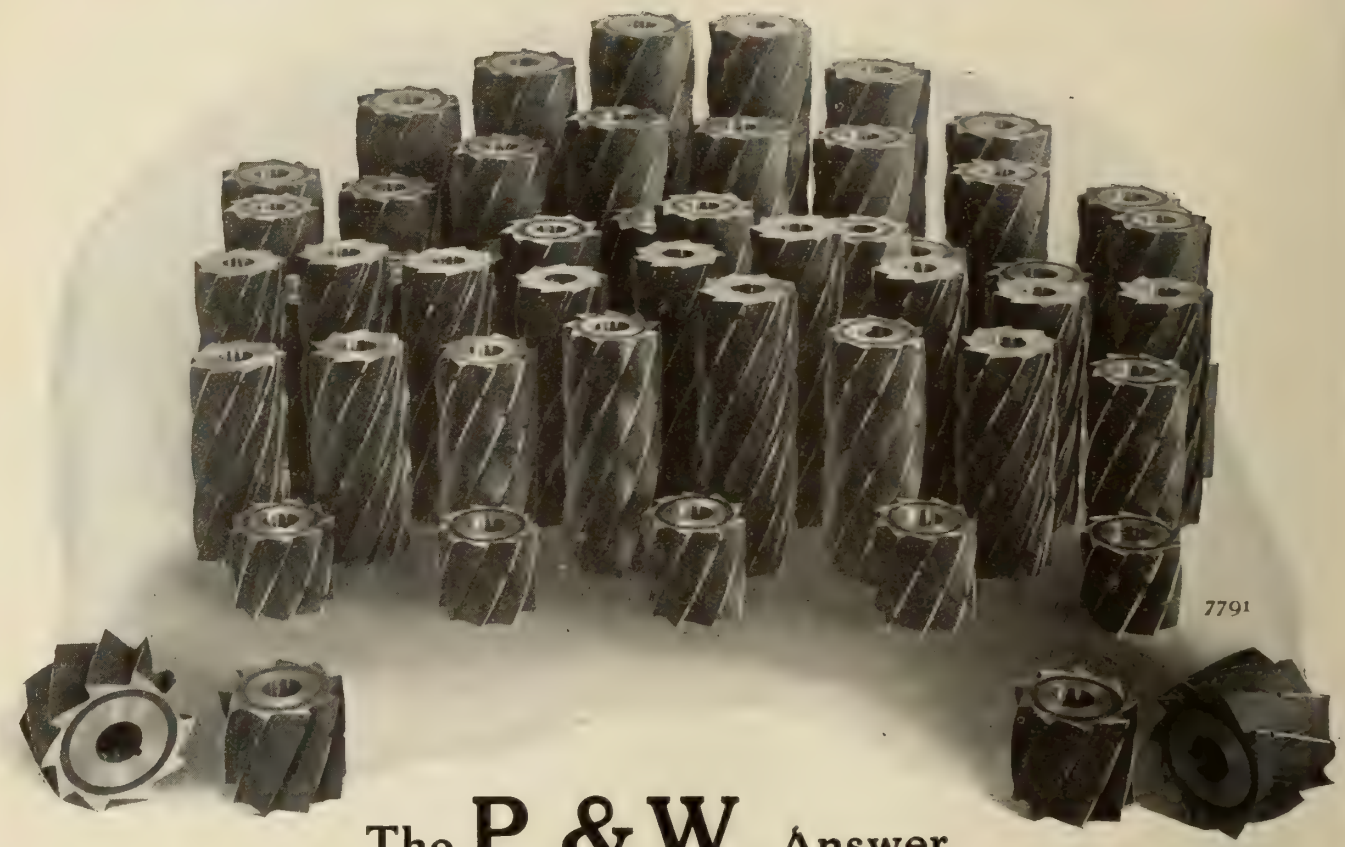
# Your Heavy Duty Cutter Problem



## The P.&W. Answer

### Use Coarse Tooth, High-Speed Milling Cutters

We are prepared to furnish promptly coarse tooth milling cutters of High-Speed Steel adapted primarily to the heavier class of milling.

**Long Life**

Such cutters have the advantage of long life as the large teeth permit of more grindings. It will also be seen that less time is required to sharpen.

**Increased Production**

The ample chip room insures a remarkably free cutting action and will increase production by a high percentage with less power required to drive.

**Strong Teeth**

The teeth being larger are exceptionally strong and will easily stand the heaviest feeds without breaking.

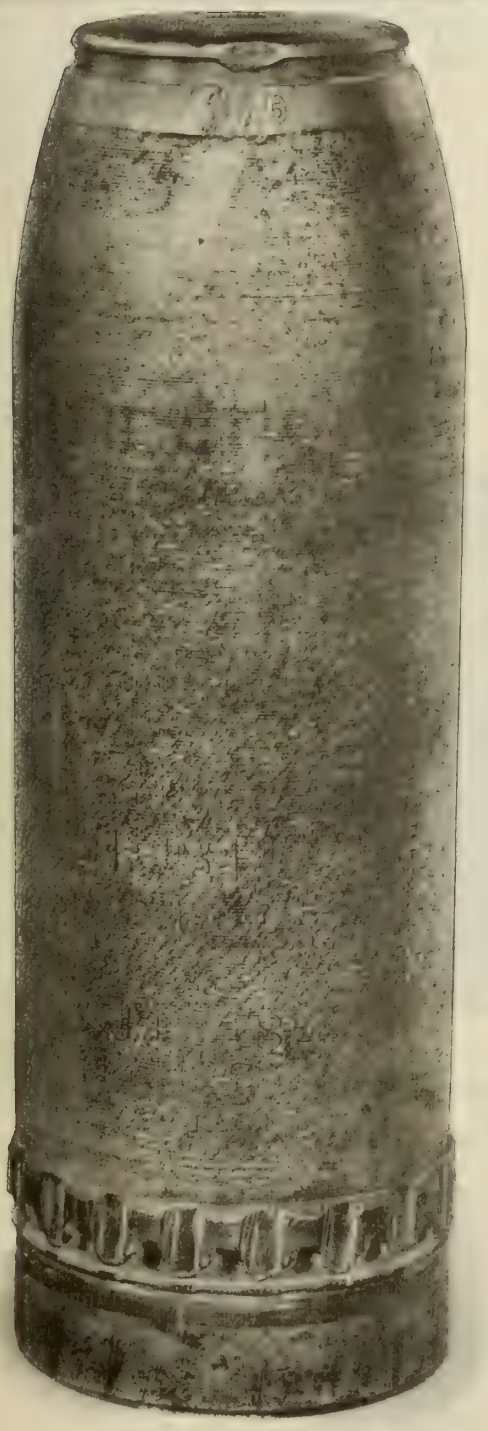
# STOOD THE TEST!



Our illustration shows an 18 Pr. Q.F. Shrapnel Shell after it had satisfactorily undergone the "Firing Proof," the final test required before acceptance of a lot of Shells by the War Office. This Final Test determines whether or not a lot of Shells is serviceable and the passing of all the other tests and gaugings in the process of manufacture stands for nothing, unless the Shell selected for the firing proof stands this *FINAL TEST*.

There is a Final Test for Machine Tools as well as for Shells, and the passing of all the preliminary tests of appearance, weight, price and delivery won't help a line of Machine Tools that can't pass the Final Test—The Test of Time.

# Finishing Shrapnel Shells

ON THE

## "MODERN" 12" x 24" Self-Contained Grinding Machine

## The heaviest, most powerful and efficient Standard Grinding Machine made for Shell work

The "MODERN" 12" x 24" Grinding Machine is especially adapted for grinding Shrapnel Shells. The Machine is more than guaranteed, it is demonstrated. Large diameter, wide face wheel, with powerful drive—automatic feed without traversing the table—absolute central control of all levers and hand wheels—single constant speed drive.

We have recently sold a large number of these Machines in Canada, completely equipped for Shrapnel Work. Ask the man who is using the "MODERN."

The large manufacturer appreciates the production possible on this Machine. Machine comes equipped for all classes of straight and taper cylindrical work.

**Send for blue prints and estimates.**

# Milling Automobile Engine Bearing Caps by the Continuous Milling Process

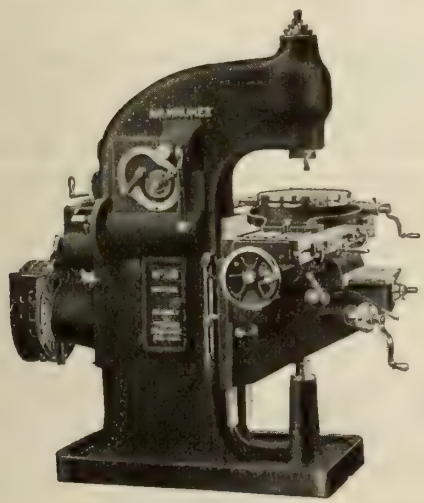
There are the automobile engine bearing caps to be machined in large quantities. And there is the No. 2½B Vertical Milwaukee Miller with rotary table and a simple chucking fixture to accomplish it.

The milling is continuous—there is no time lost in chucking. The cutter finishes piece after piece as the table revolves. The operator stands to the side or front and takes off the finished piece, chucking the unfinished pieces in their places.

The result is a production far beyond that of any other machine tool. Moreover, the pieces are given the superior finish of a face milling cutter.

There are an endless variety of parts and pieces that can be milled to the same advantage by the continuous process. It is an easy matter to design the necessary simple chucking fixture.

Production by the continuous milling process depends almost entirely upon the operator. The Milwaukee Miller will mill the pieces faster than it is possible for an operator to chuck them. In a number of cases it has proven profitable to put two operators to work, one to unload and the other to load.



Where a manufacturer has a horizontal milling machine and does not desire to undertake the expense of a vertical milling machine, the continuous milling process can be performed by using a vertical spindle attachment in connection with a rotary table.

When considering the results you can get on your work by continuous milling, consider also the machine on which you do it.

Aside from the fundamental features and advantages characteristic of all Milwaukee Millers, our vertical type machine offers several values to be found in no other vertical milling machine.

There is ample vertical adjustment, but no unnecessary and weakening adjustment. In other words, the knee is adjustable—the spindle is adjustable only to wear. Adjustment sufficient for all commercial purposes is secured by making the knee only adjustable up and down the column.

By making the spindle head non-adjustable, the main drive gear of the spindle remains in a fixed position immediately behind the main bearing of the spindle. This is a distinct advantage.

Furthermore, we are enabled to extend our cascade lubricating system to the spindle head, so that the hardened steel gears and shafts there are lubricated and flushed with more than a gallon of oil a minute, just as the hardened steel gears and shafts in the interior of the machine are lubricated and flushed.

If you have work you think adaptable to continuous milling, put your problem up to us. We will gladly make suggestions. If you do any kind of milling at all, get the complete facts about Milwaukee Millers. You will find them decidedly interesting. Just ask for our new Catalogue No. 19.

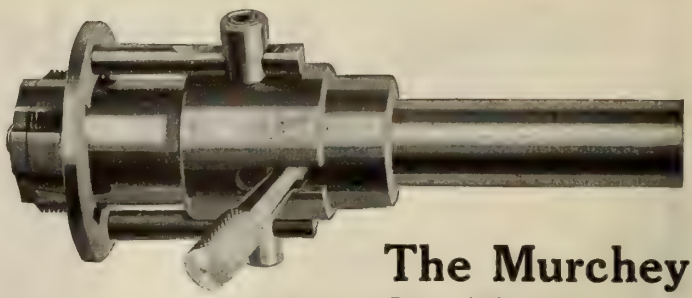
# Shrapnel Work Calls for This Collapsing Tap



## The Murchey Lever Handle Type

Made in all sizes from 1" to 12". Tripping ring is set at the point where it will come in contact with face of work when the required length of thread is made. Chasers then automatically collapse and tool is withdrawn. Expanded by lever handle and another operation started. This all counts for speed, convenience and accuracy—vital essentials on big runs of work.

## Shrapnel Manufacturers Are Finding This Out

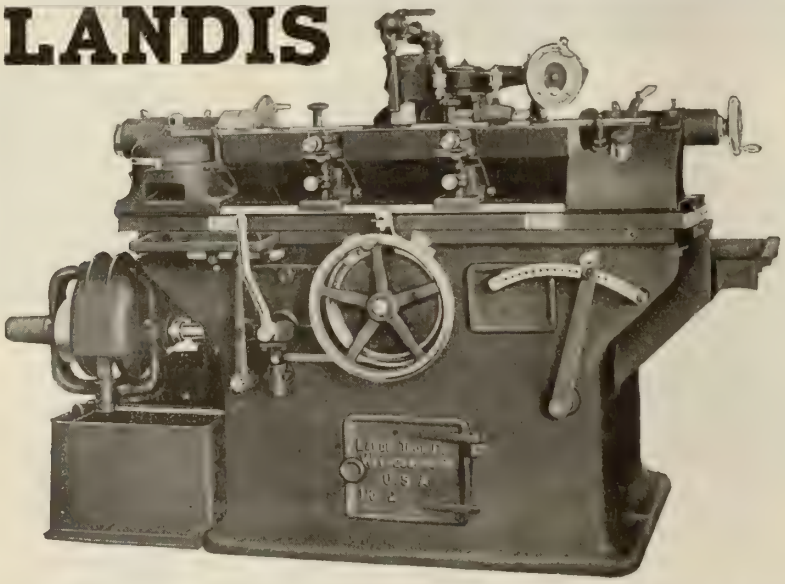
The inquiries and the orders we are receiving prove that those concerns who are making shrapnel are quick to see the advantages of using Murchey Collapsing Taps in securing their BIG PRODUCTION at the LOWEST COST, WITH THE GREATEST CONVENIENCE and in the QUICKEST TIME. Fall in line. Use Murchey Collapsing Taps in YOUR shop, working on steel. Get the manufacturing costs of shrapnel down to the lowest figure.

Murchey Service

is ready to show you definitely just where and how much these tools can save on your work. Ask for the New Catalog; and, better yet, send us blueprints. We can adapt our tools, by modification, to meet your particular require ments.

**Murchey Machine & Tool Co., 34 Porter St., Detroit, Michigan**

# LANDIS



## Combined Manufacturing and Tool Room Grinding Machine

Combining as it does both an **external** and **internal** grinder, its field of usefulness is practically unlimited. It is especially adapted to tool room service, for finishing such work as **straight** and **taper** spindles, arbors, rolls, male and female gauges, dies, reamers, plain, angular and forming milling cutters and a large variety of other work which can be held by either a face plate or chuck.

As a manufacturing proposition for accurately finishing straight or taper parts — external or internal—they assure accurate and economical production.
They will grind practically everything which can be turned on the lathe.

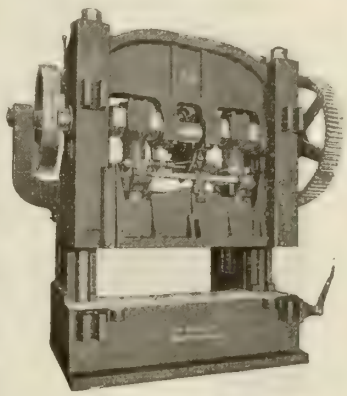
**Bliss Double Crank Presses**

Adapted for the economical manufacture of vapor stoves, wrought iron ranges, agricultural implements, paneled ceilings, metal doors, window frames and sashes, metal furniture, shingles, drip pans and countless other pieces which are within the economical production of these presses.

They are also arranged for gang punchings and for forging work.

Bliss Double Crank Presses are built in over 150 different sizes and styles, covering every requirement.



No. 28-B Weight, 65,000 lbs

# Mechanical Engineering Books

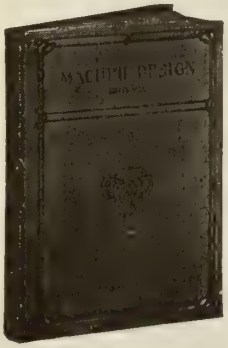
If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.

**MACHINE-SHOP WORK. By Frederick W. Turner,** Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price ...$1.50

**MECHANICAL DRAWING. By Ervin Kenison, S.B.,** Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price ..... $1.00

**FOUNDRY WORK. By Wm. C. Stimpson,** Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 142 illus. Cloth binding. A practical guide to modern methods of moulding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price .....$1.00

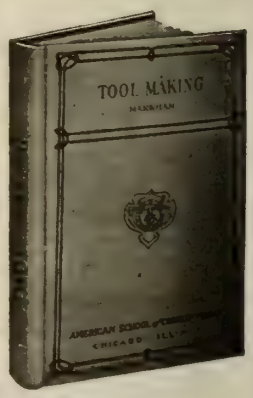
**PATTERN MAKING. By James Ritchey,** Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price .....$1.00



**MACHINE DESIGN. By Charles L. Griffin, S.B.,** Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price .....$1.50

**FORGING. By John Lord Bacon,** Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price .....$1.00

**TOOL MAKING. By Edward R. Markham,** Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers, Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels —annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price ..... $1.50



Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

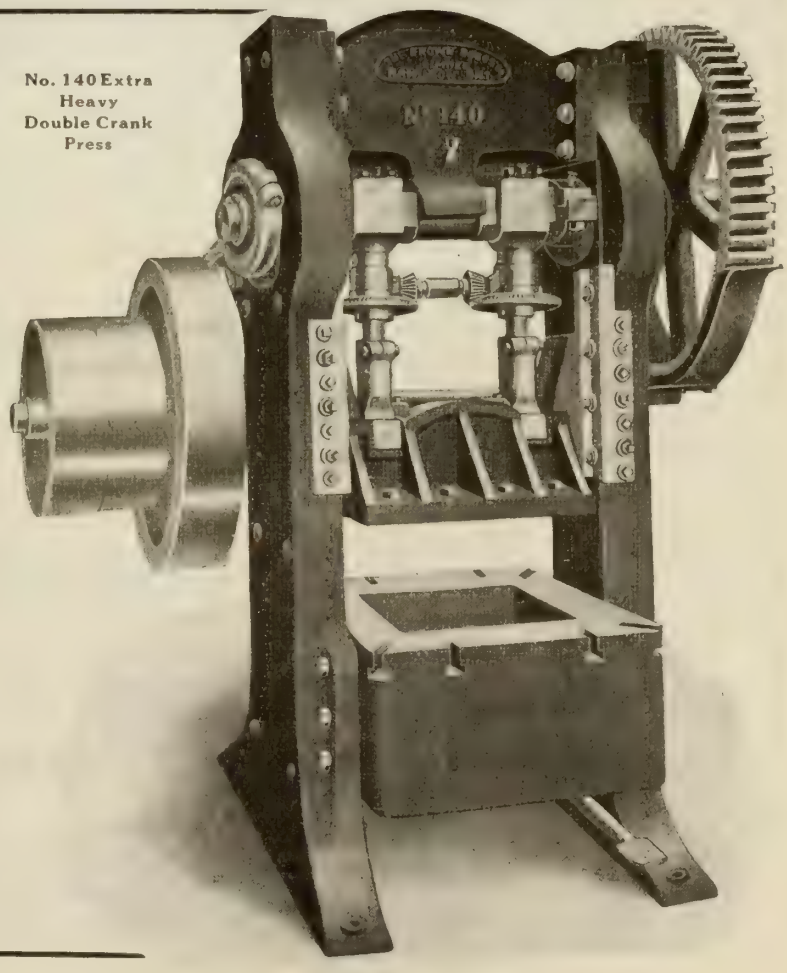
No. 140 Extra Heavy Double Crank Press



FOUR YEARS OF TOP-NOTCH EFFICIENCY FROM A ROLLING MILL DRIVE **which was always on the "under production" list.**

That is the record of this 60-inch 3-ply **Spartan Leather Belt** which was installed March, 1911, in one of the largest steel mills in the Country. When this belt was put on, the machine was compelled to roll great blocks of iron work that previous belts had never been able to do.

**Not once did the Spartan Belt slip**—nor did the work at any time clog the machine.

## SPARTAN BELTING

solved the troubles of this drive and ended the losses from the first. To-day, **March 11, 1915, after four years of unusually severe usage, this 60" 3-ply is in as good condition as when first installed.**

Spartan Belts are all the same. Inch for inch and ply for ply, they will greatly out-service any other belts made. They are guaranteed to withstand exposure to hot and cold air, water, steam, oil, gases, and heat generated by excessive pulley friction. They are particularly adapted for use on ALL DRIVES where conditions are unusual.

*The use of Spartan Belting is a guarantee of service in the highest degree possible — let us co-operate with you toward better belting service. Consult us freely — no obligations.*

# Some Jig Making Practice Considerations and Comment—I.*

By M. R. Lawrence, M.I. Mech. E.

*We have come to look upon jigs and fixtures as such highly indispensable accessories to every class of mechanical engineering equipment manufacture that we may be apt in many cases to press them into service unwarrantably. The writer in this paper seeks to point out that their cost feature should be recorded carefully in every instance so as to ensure that they have been profitably applied, as well as being contributory to quality production.*

THE author has several times been asked the apparently simple question, "What is a jig?" Chambers's dictionary says that it is a quick lively tune, or a quick dance suited to the tune. Engineers attach a different meaning to the word, but in so far as the meaning of the word is "quick and lively," is applies equally to engineering, music and dancing. We all, as engineers, look upon a jig as a device to aid, speed-up, and cheapen the making of parts which have to be alike. It stops short of the machine-tool or bench upon which it is used, and also any special or ordinary tools which actually do the cutting or holding of the cutters. Sometimes when the function of jigs is mostly the holding of the work they are termed "fixtures," and sometimes when quantities are very large they develop into special machine-tools.

The vast majority of special jigs, fixtures, tools and gauges are made to lessen the cost of production. A device may be said to do this and pay directly if its cost, plus the cost of machining the quantity of parts, is less than without it; and indirectly, when the accuracy it transmits to the pieces saves cost in the fitting-shop, or increases the production of a particular machine-tool, although the cost of the device and the cost of producing the individual parts added together is more than without it.

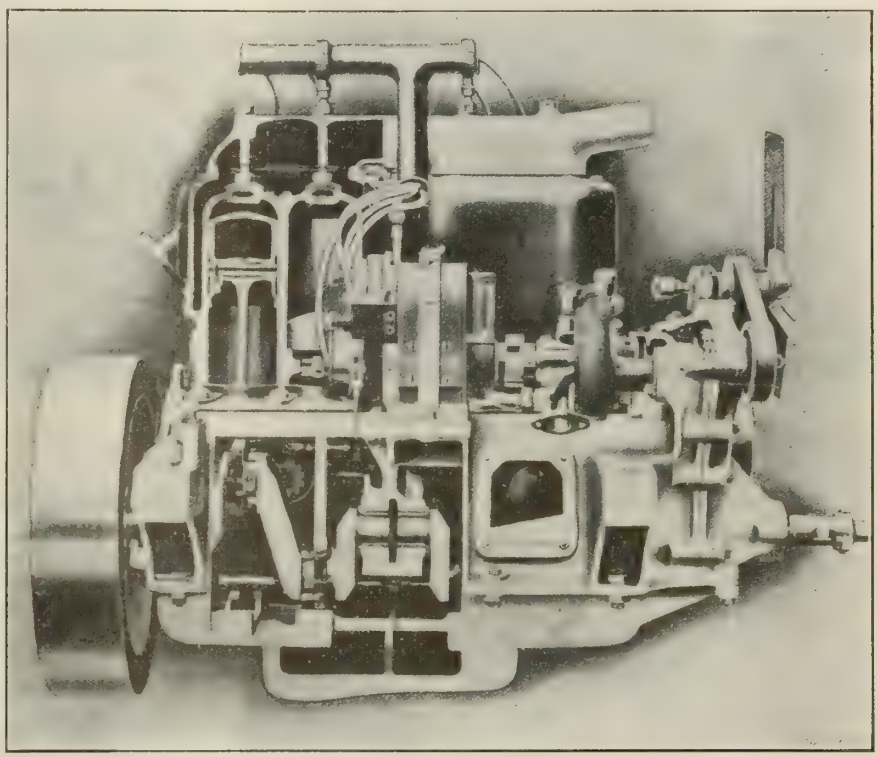

FIG. 2. SECTION OF ENGINE SHOWING CYLINDERS MOUNTED ON CRANK CASE.

*Paper read before the Manchester Association of Engineers, December 12, 1914.

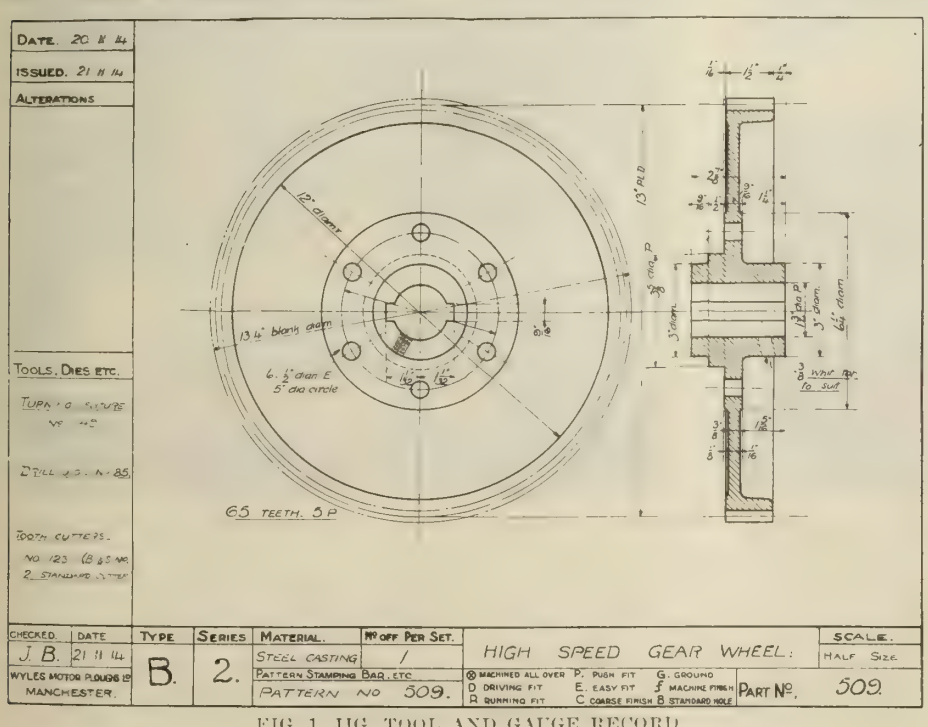

FIG. 1. JIG, TOOL AND GAUGE RECORD.

When a quantity of similar pieces has to be made, the question of what jigs should be made always comes up, and a correct decision of what to make, and how to make it, is often difficult. When the quantities are very small or very large, the decision is usually easy, but when the quantity is between the two, it is often extremely difficult. Stripped bare of all engineering interest and skill, the problem is found to be almost entirely financial. The questions always uppermost in the mind when considering doubtful cases are: "Will it pay?" "Is the trouble and expense justified?" or "Is it better to leave well alone and go on in the good old way?"

### Jig Costing.

It is, therefore, essential, in the author's opinion, to have a costing system which records the cost of the individual pieces, and also individual jigs, tools, and gauges, etc., not so much to ascertain how the money is spent at the time, which is important, but so that it may be known, when required, whether the estimated saving of a jig had ac-

tually accrued. This is of great educative value, and aids such decisions in the future. The author considers this so important that he hopes to be forgiven if he just roughly indicates how it may be readily done.

FIG. 3. MILLING MOTOR CAR ENGINE CYLINDER.

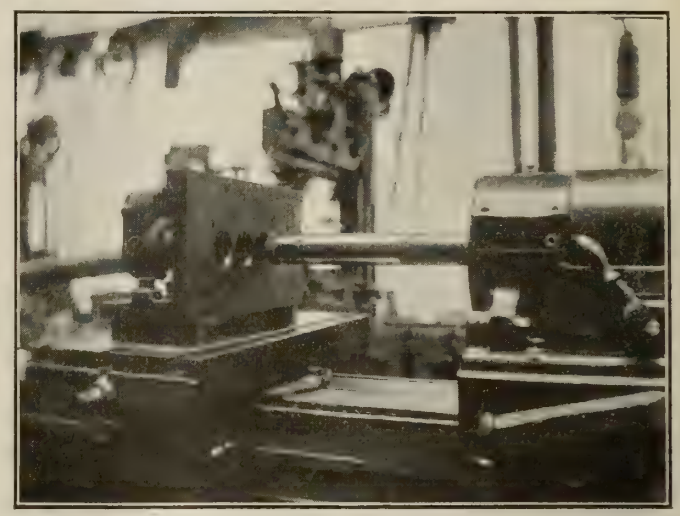

FIG. 5. INTERNAL GRINDING M.C. ENGINE CYLINDERS.

All works' accounts in their original form carry the necessary data. Each workman books his time separately, whether he is engaged on making jigs, parts to sell, or repairs, or whether he is paid day-work or by the piece. Each stores' requisition for material issued also gives such separate particulars. Why should these ever be mixed up in the office? Some fifteen years ago, when the author was engaged to lay out and manage a works in the Midlands, he devised and installed a system whereby individual costs of the parts made were obtained. The method adopted for cost-

pairs or adjustments to them is charged to R T or R G as a prefix to the number. This is very convenient, because repairs always have to be put in hand instanter by the foreman, and this makes it easy for him to book the cost correctly.

Close experience over a number of years of this method of dealing with this important side of jigs, tools, and gauges has given the author confidence. It minimizes the evil of having open order-numbers running for long periods in the works, which sometimes form such a convenient dumping-ground for waste labor. It has many other advantages.

fault. The author has found, when the applicant has to supply the answers to the questions: "How much each will your jig save?" "How many are there to be made?" "What will the jig cost?" that the matter can be settled out of hand to everybody's satisfaction. When the policy of the management as to the amount of saving to be capitalized becomes known, only useful suggestions are put forward. The author considers that taken as a general rule, a jig should not cost more than 75 per cent. of the saving it brings about. Thus, if a jig is calculated to save 1 cent each for 100

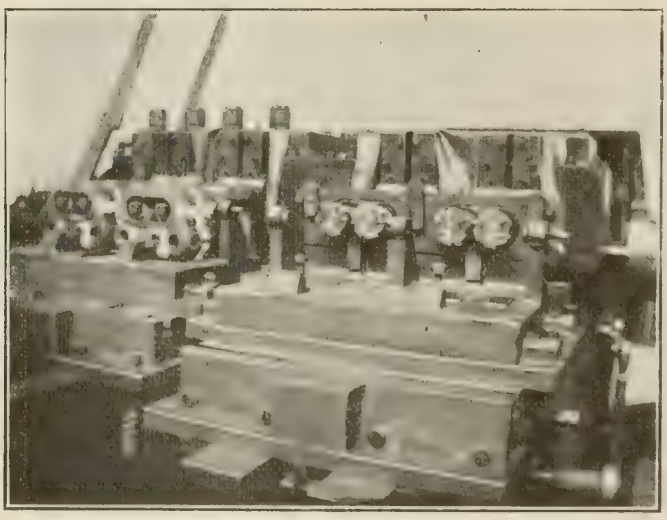

FIG. 4. MOTOR CAR ENGINE CYLINDER SET FOR BORING.

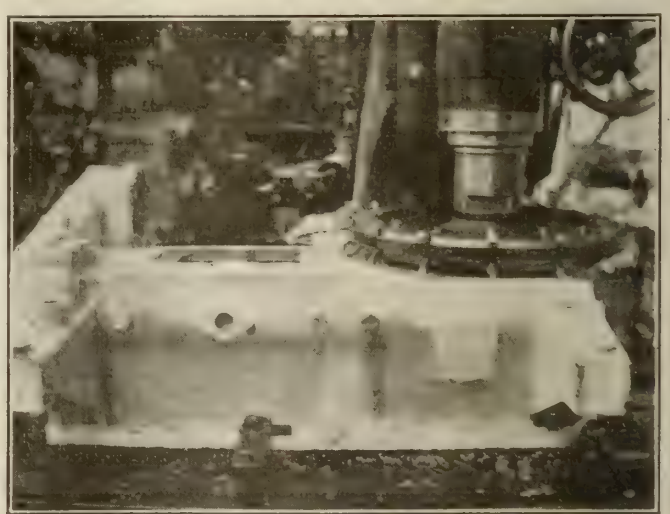

FIG. 6. MILLING CYLINDER SEATS ON CRANK CASE.

ing jigs can quite easily be used in any works without any interference with the cost system in use, whatever it may be. It is as follows:—

All jigs, tools, and gauges should be numbered. These numbers, with the

not the least of which is the power to deal quickly with the suggestions of foremen and operators. They usually take the form of a request for some jig or tool which will lessen the cost of production. Often, time does not permit the

parts, it should not be made unless its cost is less than 75 cents.

The number and operation for which jigs, tools, and gauges are used should be recorded on the drawing of the piece. This may be done either by records on

the tracing, Fig. 1, or by sticking a list on to the works' print. This will involve a small delay in issuing orders for jigs, but the great convenience to the works makes it well worth while. These records of jig numbers on the drawings save a great deal of time, trouble, and money in the works, especially when replacements have to be made for designs no longer current. When a proper system is installed for dealing with this, no delays arise.

### Jig Design—"Spotting Point" Location.

In jig design the most important point is the correct location of "spotting-point" of the piece. Often far too little attention is paid to this, and the larger the quantity to be handled the more important it becomes. There are two golden rules which should be rigidly observed:—

1.—In order that a jig or tool may be successfully located, the accuracy of any machining operations must never be input upon the castings. Corollaries to these rules are:—

1.—The greater should never be located from the less. If this is done, slight errors multiply, and conversely are minimized.

2.—When two operations have to be true to one another, the second should always be located from the first. If the first is generated from another face, it is wrong to locate the second from this face where great accuracy is required. Pieces are sometimes not properly placed in jigs; dirt or burrs may get between the locating faces. This may not be serious if the next operation copies the inaccuracy so introduced, but may cause waste when this rule is departed from.

The machining of two pieces, a motor-car cylinder and its crank-case, will be described to illustrate these important points. The crown and barrel of the cylinder are made as thin as possible, so that the heat may readily escape through them to the water in the jacket. It is important that their thickness should be approximately even, because differences cause distortion due to the difference of temperature between the thick and thin sides. The jacket cores which determine this thickness are built up, and may be misplaced, so that if the casting is located from the outside of the jacket, it may "clean up" all over and yet not leave an even thickness of metal around the barrels. It is defects of this nature that probably account for the mysterious differences in form between engines of the same design so often noticed and commented upon.

Fig. 2 is the section of an engine showing the cylinders mounted upon the crank case. It will be observed that the location between the two which secures alignment is the flat face on the cylinder-foot meeting the flat face on the crank-chamber in the one direction, and the bolt-holes are used to locate them in the other. The water-jacket around the cylinder is too restricted in area to allow of a fixture being introduced of sufficient size to locate the casting truly by the outside of the barrel, and take the force of a cutter while any face is machined. The casting is, therefore, set up on a surface-plate, and marked out. Bent scribers of a suitable shape are used, and when the casting has been set up true to the outside of the barrels, lines are scribed upon it. The first operation is to set the casting up, and mill the foot true to the scribed lines.

The second operation, Fig. 3, shows it standing on this face and being machined on the side of the carburettor and the top of the water-jacket, the castings for these two operations being mounted on plates carrying convenient faces for the scribing-blocks to work from while setting.

The cylinders are then bored on a special machine, illustrated in Fig. 4, the casting being strapped tightly on to the machined foot, and located for height on the carburettor face, and set true sideways again to scribed lines. The barrels are then rough bored, the castings taken off, and allowed to cool and season for at least twenty-four hours, after which they are mounted again on the other side of the machine, and a cut taken to within one-hundredth of an inch of the finished dimension. The rest of the machining of the castings, the valve-guides, ports, and the holding-down bolt-holes, are located from the foot and the bores, to which they have to be true, and the final operation is illustrated in Fig. 5, where the whole casting is set up on the foot, and located from the holding bolt-holes, while the barrels are ground absolutely true and to size.

In scheming for these jigs and deciding upon the sequence of operations, a much simpler set could have been constructed had a datum face been ma-

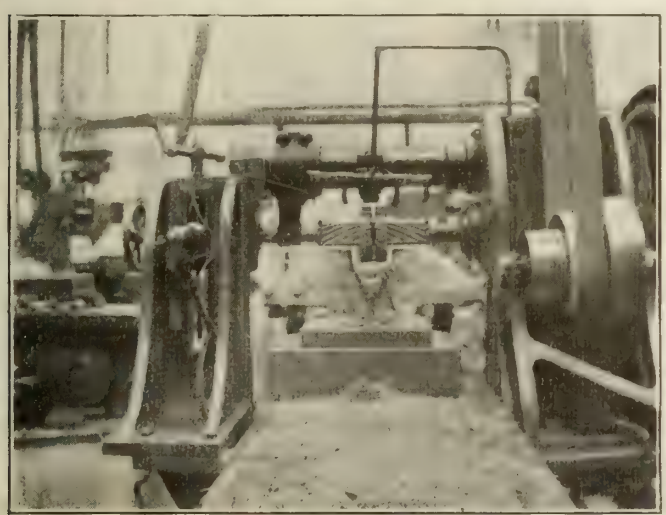

FIG. 7. MILLING PLUMMER BLOCKS ON CRANK CASE.

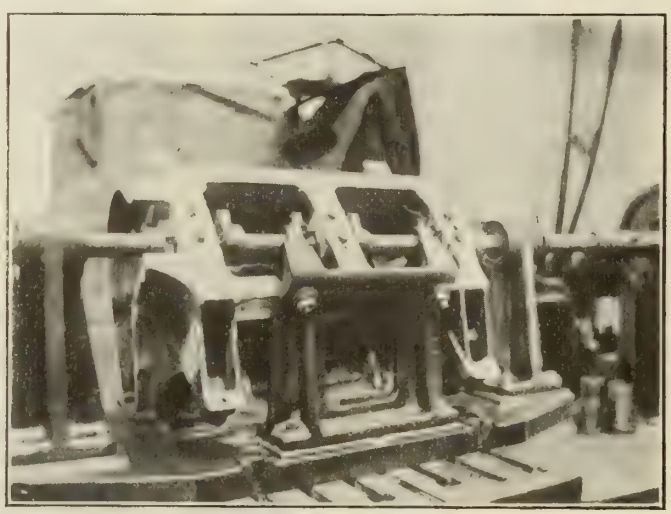

FIG. 8. BORING CRANK CASE.

creased beyond the requirements of the function of the part; and 2, which is really the same—in other words, that no extra face or part be machined for location purposes only.

Accuracy costs money, and live foremen and operators only trouble about it to the degree necessary. Hence, when a piece is not strictly to drawing, and the inaccuracy is unimportant to the proper function of the part, it should pass on to the next operation. If, however, the inaccuracy becomes material because it affects the location in a subsequent jig, it calls for special treatment, and unnecessary waste is made, or the jig put out of action for all or a percentage of pieces. The same principle applies to the location of thin castings with cores. They must be located from the correct places, so that if the cores have been misplaced, the error is detected before an undue amount of work is

chined for location purposes, and at one time this practice was followed. It, however, produced very bad work and barrels of very uneven thickness, because, when the metal had been removed from the bore and the foot, where it was left very thick for casting reasons, and the scale broken on the other machined faces, it was found that some castings changed in shape very much. The author has measured barrels which were perfectly true as soon as they had cooled after removal from the boring machine, the bores of which distorted as much as two-hundredths of an inch out of parallel during the next twenty-four hours.

The set of jigs and the sequence of machining operations described properly safeguard the essential functions of the part. They automatically ensure a good even thickness of metal around the barrels, and that the whole of the machining of the casting is true to the final locating face when it is put to work. The marking-out operation has survived, although many attempts have been made to do away with it on a production which handled about 10,000 castings per annum. The percentage of absolute rejects from misplaced jacket-cores was probably not two castings per 1,000, but as the amount of metal removed from the inside of the barrel and the foot was great, no doubt many castings were saved and finished to the desired accuracy that would have been defective had other locating or "spotting points" been adopted.

This piece and its liability to distortion form most excellent instances of why departure from the rules laid down sometimes leads to disaster. Even the most innocent pieces may develop some unexpected irregularity. When once these rules are treated as axioms, it will be found that jigs locating from the correct place do not really cost more to make than those which work from some artificially-constructed "spotting point." If they do cost more than is justified by the saving they would bring about, they should be ruled out and not made, and the problem dealt with in another way.

The crank-case, which is also a complicated casting made with many cores, is likewise set up and marked out. The first operation, Fig. 6, is milling the seat for the cylinders; the second operation (Fig. 7) is straddle-milling for the plummer-blocks of the crank-shaft bearings and oil-base face, and is located from the first. This is one of the few cases where an apparent departure can be made from Rule 2. It will be observed that two straddle-mills are used to machine the outside edge of the case, and provide a face truly parallel to, and at a definite distance from, the centre of the crank-shaft. It is legitimate, because any possible inaccuracy is quite unimportant.

The casting is then mounted (Fig. 8) upon an angle-plate on a boring-machine in such a position that the axis of the crank-shaft and the cam-shaft are truly horizontal. There is no special feature about this jig except that it will be noticed the location is taken from the cylinder face and the previously-referred-to straddled edge. The cutter-bars are guided by hardened and ground bushes attached to the jig and driven through universally jointed shafts from the boring-spindle.

## HISTORY OF THE CANADIAN LOCOMOTIVE COMPANY.

MORE than sixty years have passed since the first locomotive-building plant in Canada was established at Kingston, Ont. The works of the Canadian Locomotive Co., started in a small way in 1850, and have been operated up to the present with varying success, and under several different managements. They have passed through the many vicissitudes experienced by all large manufacturing concerns, until to-day they form an industry of recognized importance.

CANADIAN LOCOMOTIVE PLANT, KINGSTON, ONT.

with records of having built locomotives of every description for the different railroads in Canada.

The works were established in 1854 by Messrs. Tutton & Duncan, and in 1865 were taken over by a company formed mostly of Montreal men, and known as the Canadian Engine and Machinery Co. In 1881 the Canadian Engine & Machinery Co. was re-organized, and, with the late Hon. Sir George Kirkpatrick, as president, and the Hon. Wm. Harty, of Kingston, as managing director, business was carried on most successfully till 1886, when the company passed into the hands of Dubs & Company, of Glasgow, Scotland. Fourteen years later, in 1900, the company was again re-organized, this time by the Hon. Wm. Harty, who was its first president. It then became known as "The Canadian Locomotive Company, Limited." The plant was improved by the installation of new equipment, new buildings were erected, and the output capacity increased.

It was at this time, when further additions to the plant were under consideration, that the success with which the company was operating, gained for it the attention of some well-known capitalists. In April, 1911, the works were visited by Aemilius Jarvis and some British associates, and, a short time after Aemilius Jarvis & Co., bankers, Toronto, made an offer of purchase, behind the offer being a proposal to form a new company with a greatly increased capitalization. The offer was considered by the shareholders at a meeting held on May 26, 1911, and was accepted.

As a result of these negotiations the company was reorganized under the name of "Canadian Locomotive Co., Ltd.," the capitalization was raised from $500,000 to $3,500,000, and a new directorate board was formed. Hon. Wm. Harty was made president of the new company, and the following directors were elected:—F. G. Wallace, Pittsburg, Pa.; Robert Hobson, Hamilton; W. Y. Sopher, Ottawa; Aemilius Jarvis, Toronto; James Redmond, Montreal, and J. L. Whiting, Kingston.

A progressive policy was immediately entered upon by the new officers. A large sum of money was set apart for the erection of additional buildings and for the purpose of new machinery and equipment, and A. W. Wheatley, of the American Locomotive Co., was engaged as general manager. Since this last reorganization, further changes have been made, Aemilius Jarvis being now president, and A. W. Wheatley, vice-president and general manager.

The progressive policy adopted by the new management has been productive of most encouraging results. The enlargement of the plant and the installation of new equipment has been such that at the end of 1914, the company was in a position to turn out 25 engines per month, or 300 engines per year. The plans for enlargement of the plant have been carefully prepared, and permit of considerable further additions.

**Renfrew, Ont.**—At the annual meeting of the Renfrew Board of Trade, W. F. Smallfield was re-elected to the office of president. H. W. Airth was elected secretary.

# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## TURRET LATHE AND VERTICAL BORING MILL PRACTICE.—V.

By Albert A. Dowd.

UNDER this heading in our last issue in this section, the "Machining of a Spoked Type Farm Gas Engine Fly-wheel," was described and illustrated. Continuing the series of articles, the "Machining of a Plain Clutch Fly Wheel' 'is here featured.

### Machining a Plain Clutch Flywheel.

The type of fly wheel shown in Fig. 4 at A is to be machined all over, and the tool layout for the first setting is shown in that illustration. As in the former instance, the external and internal surfaces must be so machined that they will be concentric with each other, in order that a proper balance may be maintained when the engine is running at a high rate of speed. Concentricity is also important on account of the clutch member which works against the large internal surface of the rim.

A set of special jaws B is used to hold the work by the inside of the rim, sufficient clearance being left at C to allow for undercutting in the first setting. The tool D in the standard tool holder E is used to rough bore the clutch surface and also to face the upper side of the rim, while the tool P in the side head turns the outside diameter. A reference to the illustration will make it clear that the amount of surface to be covered by

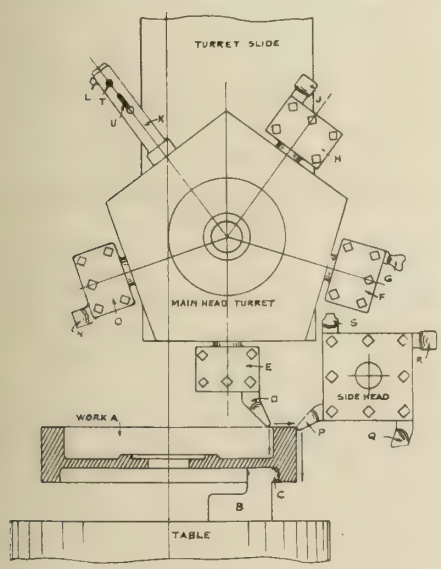

FIG. 4. TOOL LAYOUT FOR FIRST SETTING.

the tools D and P is about equal so that they will complete their work at approximately the same time. It should further be noted that as there is very little difference in the diameters on which the cutting action takes place, there will be very little loss of time due to incorrect speeding. Attention is called to the fact

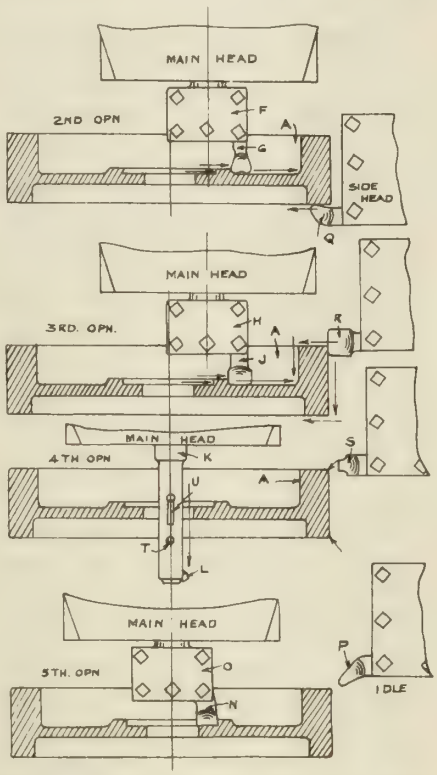

FIG. 5. TOOL LAYOUT FOR 2ND, 3RD, 4TH AND 5TH OPERATIONS.

that the only special tools required for this setting are of the forged variety and therefore the expense of tooling is very slight.

Fig. 5 shows the various positions of the tools for the 2nd, 3rd, 4th and 5th operations. The 2nd operation consists of roughing out the holder, facing the hub and rough-facing the web of the wheel with the special tool G in the regular tool holder F as indicated by the arrows in the illustration. While this operation is taking place with the main head, the side head tool Q is utilized to undercut the rim, and in this connection it should be noted that we have so constructed the jaws that they will allow this tool to pass the edge of the rim without interference.

In the third operation all the interior and exterior surfaces which have previously been roughed are finished by the tools J and R in the main and side heads. With the exception of the shouldered portion of the web all these surfaces are finished to size in this operation, a few thousandths being left on the shoulder for the final sizing cut.

The main head turret is now indexed, and the three cutter bar K brought into play. This bar contains a tool L at its lower end which is used for roughing out the hole. A short distance above this and set at right angles to the other cutter is the finished boring tool T, while still higher up is the flat floating reamer cutter U which sizes the hole. Immediately after the reaming cut has been finished, the side head tool F rounds the two corners of the rim. The final and fifth operation consists of sizing the shoulder with the tool N in the tool holder O. A noteworthy point in this arrangement for sizing is that the main head is brought to the centre stop and the tool so set in the holder that it will produce the correct diameter when in this position. Very accurate results can be obtained by this method of procedure and an expensive piloted sizing tool may be dispensed with.

The second setting of the work is of such a simple nature that it does not require illustration, the only point of importance being that the work is located on a fixture, from the shouldered portion. The machining is obvious.

## FIXTURE FOR PLANING LINKS AND BLOCKS.

By G. Barrett.

THE planing of links is one of those jobs on which a great deal of time can be lost or saved, and therefore only a few are required to make the provision of a special fixture a desirable undertaking. In the accompanying illustrations is shown a fixture for planing the link A, Fig. 1, to a perfect radius. The plan of the arrangement as set up on the planer is shown in Fig. 2.

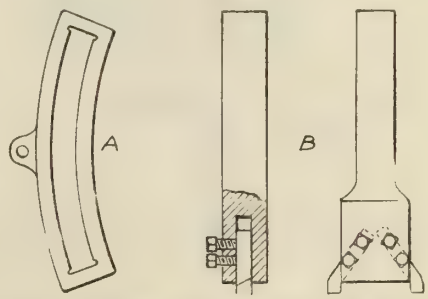

FIG. 1—A—TYPE OF LINK TO BE PLANNED AND B—ADJUSTABLE TOOL FOR THE PURPOSE.

The fastening of the work is accomplished by means of four set screws which are also used for locating it. The construction is well shown in Fig. 3.

The cast iron base plate A, is bolted to the planer table in such a position that its centre is in line with the centre of motion of the table about the point where the arm D is fastened to the bed. In the centre of the base plate is drilled and tapped a hole to take the pivot screw upon which the upper casting B swings.

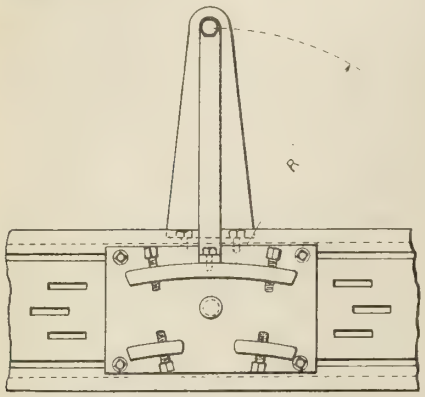

FIG 2. LINK PLANING DEVICE SHOWING SWINGING MECHANISM.

The bracket D may either be cast or be of angle iron, and may be made to take in links of different radii this radius being determined by the position of the cap screw C. The swinging of the upper casting B carrying the link is accomplished by an arm bolted to it, and swinging about C by means of a slotted hole. Care should be exercised in making the various parts heavy enough to provide the necessary stiffness, particular attention being given to the pivot screw. The swing bar in the present case was made of ¾ x 3 inch flat machine steel. With a little care in marking locating points, the fixture can be quickly set up and taken down, and the work carried out without any trial cuts.

The type of tool used is shown at B, Fig. 1. This is made in both roughing

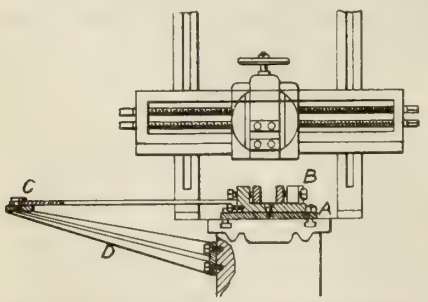

FIG. 3—LINK PLANING FIXTURE SHOWING METHOD OF CLAMPING AND ARRANGEMENT OF LEVERS.

and finishing sizes and can be readily adjusted by simply moving the tools forward or back. The link blocks can be readily planed in the same fixture by simply providing means for clamping the block in the centre of the upper or rocking plate. The hole in its centre greatly simplifies this operation.

## A HOME-MADE DIE STOCK.

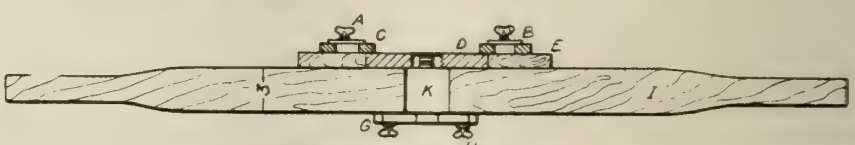
By J. E. Noble.

A considerable part of the writer's life has been spent in rural and outlying communities, chiefly in the selling, erection and repairing of machinery. Such an experience is productive of many interesting episodes and ingenious methods and devices are more common than in large plants well supplied with time and labor-saving apparatus.

The accompanying illustration is that of a die stock and is the enforced product of one of those plants whose owner considers every item of supplies other than coal as needless extravagance. The engineer, being up against it for a pipe threading tool and being neither convenient to where one could be bought nor being disposed to spend his meagre earnings in this way, developed the contrivance shown.

The stock proper I, is made of a piece of hickory nicely shaped and having a hole through its centre large enough to clear the largest sized pipe required to be cut. Two blocks E are strongly fastened with screws on either side of the hole and equally distant from it so as to take the die D snugly between them. The die is held down by the steel plates C and the thumb screws A which work in slotted holes to permit removal of the die.

The guide plates G are made of flat steel and are in the form of vee blocks



A HOME-MADE DIE STOCK.

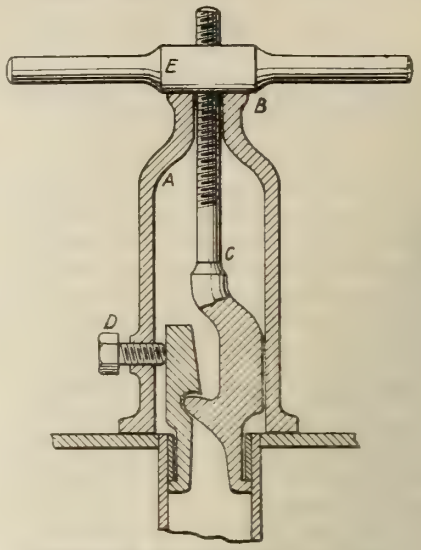
held in place by thumb screws working in slotted holes. In operation, the stock is slipped over the end of the pipe and is squared up with it by adjusting the plates G, after which as many threads as required can be made without readjustment.

The above device is not to be reckoned as possessing much real value in these times when tools are plentiful and fairly cheap. It did the work, however, and did it well, and may serve to set some engineer thinking along a line that will help him out of an equally difficult situation.

## TOOL FOR DRAWING FERRULES FROM BOILER FLUES.

By Geo. Barrett.

THE illustration herewith shows a simple tool with a wide range of usefulness. It was made for the purpose of drawing ferrules from boiler flues, but a cursory examination will suggest many other uses for the appliance. The body A is a steel casting or may be forged. It is drilled out at B to take the pulling screw



FERRULE PULLING APPLIANCE

C which is forged to the shape shown and is screwed with a square thread.

The operation is self explanatory. The handle E is unscrewed to permit the dogs entering beyond the ferrule. The grip is made fast by screwing down the cap screw D. With a little judgment the apparatus can be made fairly light and the most refractory ferrule comes out by its aid very easily. The device can be improved for light work by putting a thumb screw in place of D and a spring around it between the loose dog and the frame.

## ONTARIO WORKMEN'S COMPENSATION ACT.

UNDER Section 101 of the Ontario Workmen's Compensation Act, manufacturing groups are authorized to form protective associations in order to reduce risk of accident, and, consequently, their rates of assessment.

A general movement is now under way among manufactuerrs to take advantage of this clause. The first to form a protective association were the small electric power companies. The canners followed, and the quarrymen and meat packers have now incorporated their protective associations. Machinery builders, iron and steel fabricators and erectors, flour millers and others are in process of organization.

The idea of the Compensation Act is to charge just what compensation costs.

## TECHNICAL AND INDUSTRIAL EDUCATION.

By J. P. Sanderson.

THE national economic value of technical education is gradually but surely impressing itself upon our administrators, national, municipal and commercial, the basic principle being realized to an extent never before that if education enables a man to utilize and dispose of profitably his country's national resources as these may be available to him, the resultant general effect will be his desire to conserve and reproduce these resources by every means possible, and incidentally, whatever individual benefit be derived, there is reflected a more or less equivalent benefit to the great mass of citizens as a whole.

The firemen at the boilers has a much better opportunity of economizing fuel than the man who buys it. Again, the mechanic at the machine tool will be the first to observe short cuts in production which will eventually lower the cost of manufactured goods and thus make them more available to the general consumer. Until the comparatively recent educational movement, however, relatively few firemen understood, even in a rudimentary sense, the chemical processes of combustion, and the man building an engine or other mechanism could rarely explain the fundamental principles upon which his machine depended for its successful operation. The results of vocational training abroad, the wide dissemination of technical literature and periodicals and the rapid mechanicalization of our everyday life has developed a desire and a need of a better groundwork, education in natural science. In fact, rapid as has been the advance in technical education, our requirements in this line are growing at a still more rapid rate.

Technical schools may be said to have had their beginning in Great Britain through the night classes originated by Prof. Perry for the Civic Guilds of London. From these the day school branch of the technical school work has been gradually developed. The original British idea of a technical school has, however, been maintained, that is, a school for the purpose of imparting technical education to mechanics at times when they are not engaged in their regular occupation. Some of the larger British schools have as many thousands enrolled in the night classes as there are hundreds connected with the day schools, which would seem to indicate that the kind of teaching required by night students is not popular with those who are free to attend during the day.

In the United States the system seems to have originated in the technical high school, night schools being left largely to the Y. M. C. A. and similar institutions. The purpose of the technical high schools seems to be the provision of a high school in which applied science and vocational training is undertaken to the same extent as literary, historical and similar subjects are treated in the regular high schools. The education is thus more or less confined to students wishing to prepare themselves for positions of supervision in connection with trades or manufacturing plants, or to those who are too young to take up the learning of a trade in the usual way.

In Canada are to be seen the best efforts to reach the greatest number of needy students. Night school courses in vocational subjects are, as a rule, planned to be of direct assistance to the student in his daily work, the teachers being men from the ranks, who are best fitted to cater to the requirements of the ambitious mechanic. The day classes on the other hand, furnish to the boy who is planning a mechanical career the necessary mathematics and technical training that cannot be obtained at the regular grade or high schools.

There was a pronounced tendency in the earlier technical schools—still existent in numerous instances, to employ men of very high scientific and technical standing as teachers. The result, however, has generally been that the work in the vocational branches gradually gets out of the sphere of the shop men who need it, most of whom probably had to leave school in order to earn a living. Attempts have even been made by some to furnish a professional rather than a vocational education, but this cannot supply the greatest need and must necessarily fail in its ultimate purpose. The financial stringency, while interfering with the building of new schools, is increasing the student interest in those already at work and there is, therefore, all the more necessity for the strict adherence to a practical curriculum.

While there have been no large new schools, established during the year just passed, business stagnation, war and similar causes may be rightfully ascribed as the deterring agents, several undertakings which had been planned throughout the West having been postponed. On the other hand, several very large institutions, notably the new Toronto technical school, have proceeded apace and this will shortly be ready for occupancy. In the matter of technical education and the establishment of technical schools in Canada, considerable progress has been made in the cities of Medicine Hat and Lethbridge while the city of Calgary has extensive plans in these directions. The city of Winnipeg has two technical schools both of which are well patronized while that of Vancouver, though not the largest in scope is perhaps the pioneer institution of the West.

The results of the work of technical schools are not long in following the establishment of the schools themselves. The banner manufacturing Province of Ontario has long contributed the most towards technical education and the recent rapid growth of manufacturing industries in Quebec Province was preceded by the founding of technical schools in the cities of Quebec and Montreal. The popularity of and profit to be derived from technical education are indicative of our desire for greater industrial development and that the latter will be realized in full measure in the coming days, we have every confidence.

## REDUCING CONSUMPTION OF COTTON WASTE.

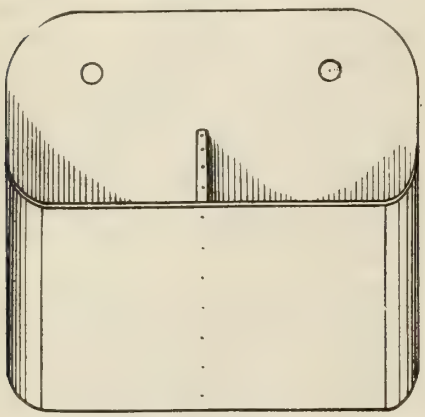
By P. W. Blair.

THE cutting down of the monthly consumption of cotton waste has received considerable attention from the officials of a leading western Ontario plant engaged in the manufacture of iron and brass goods. Several plans have been tried in succession with varying results, the following one being finally adopted as the most easily put into operation.

The working value of any cotton waste depends upon its length of life, cleanliness and absorbant qualities of the thread stock from which it is made. For this reason, a low priced waste of inferior quality is, in the long run expensive. Besides, there is no possibility of washing such waste even if the plant be equipped to do the work. It is often said, on the other hand, that the higher priced waste receives no better care than the poorest grades and the advantage of quality is therefore lost, in the average factory.

Waste is used in so many places and for so many purposes about a shop that the proper adherence to the fire underwriters' regulations is difficult in any case. The plant in question surmounted all these difficulties by distributing an allowance of the material to each bench and machine twice a week. This work was done by the caretaker who also collects the dirty waste and sees that the receptacles are not used for any other purpose.

To each machine is attached a sheet metal pocket for the reception of waste.



CONVENIENT METAL WASTE RECEPCACLE.

This is placed somewhere within easy reach of the operator and is arranged to hold both fresh and cleaned waste as shown in the sketch. Similar pockets are provided for the benches and thus a definite place is made for every piece of waste that has any right to be in the factory. There is now no waste stowed away in workman's tool boxes or scattered around on the floor or under benches, and inspectors of the fire underwriters have heartily endorsed the system.

The consumption of waste has been reduced about forty per cent. and incidentally, the appearance of the shop has been very materially improved. It has been found also that little, if any work has been added to the duties of the caretaker as the elimination of the waste nuisance has lightened his work in other directions.

## NEW PROCESS FOR PRODUCING GASOLINE.

THE discovery is announced by the United States Bureau of Mines of two chemical processes, one of which it is claimed will be of tremendous importance to the oil industry, greatly increasing the supply of gasoline, while the other may make the United States independent of Germany and other nations for supplies of materials necessary for the dye industry and the manufacture of high explosives used in warfare. The first of these processes promises to enable the independent refiners to increase their output of gasoline from petroleum 200 per cent. or more. With an estimated production on the part of the independent refiners of 12,000,000 barrels of gasoline in a year, this will mean an output from independents alone of 36,000,000 barrels, being greater than the total production to-day from all sources. The second process includes the manufacture from crude petroleum of what is known chemically as toluol and benzol, both of which have been heretofore obtained from coal tar.

The discoverer of these two valuable processes after many years of research is Dr. Walter F. Rittman, chemical engineer of the Bureau of Mines, the work having been done at Columbia University, New York, the facilities of the laboratory there having been turned over to the Federal Government by President Cutler.

## PERCENTAGE OF EYE ACCIDENTS HIGH.

IN a recent report of the Industrial Commission of Wisconsin, it is shown that over 70 per cent. of all the injuries to workmen caused by chips, nails and other small objects affect the eyes. Out of a total of 346 cases reported, 32 men lost the sight of one of their eyes entirely, 217 had eyes injured, 75 suffered from lacerations, 7 from impaired sight and 15 from bruises. The causes of the above injuries were as follows: 283 were hit by chips, 14 by nails, 4 by stone from blasts, 3 by bursting water-glasses and 42 by other small objects.

The Commissioner further states that of the 70 per cent. it is safe to say that fully three-fourths of these eye injuries could be avoided by the wearing of goggles and in fact, within the past year, many Wisconsin plants have adopted the use of goggles and as a result eye injuries have been almost entirely eliminated.

## THE CONDUCT OF LIFE.

A topic of considerable interest recently discussed in the press, says G. W. Buckthought, in the Great Eastern Railway Magazine, is that of the cause of the conspicuous dearth in these days of great men. Educational methods may largely be responsible, but the root of the whole trouble, one thinks, is the current theory in regard to the proper conduct of life. Lord Haldane in his inaugural address as honorary president of the Associated Societies of Edinburgh, Scotland, gave utterance, we think, to some very sound principles of life and conduct. His views are worthy of the widest circulation, and the following notes cannot fail to hearten, enlighten and guide all who read and inwardly digest them:—

Each man must shape his own destiny, and work out his own salvation.

Beware of morbid concentration on your own private concerns.

We are all subject to reverses. Provide against the depression which they bring in their train by acquiring the large outlook which shows they are not the most important things in life. The only foundation of what is abiding is the sense of the reality of what is spiritual—the constant presence of the immanent Deity.

Devote your highest energies to attaining to the largest and widest view of life. It will come to you and bring you all its sustaining power, if you strive hard enough. Christianity, philosophy, are media for the revelation that the ideal and the real are but different aspects of a single reality.

Accept what comes to you undisturbed. A man is stronger as well as better and has more power of influencing circumstances as well as other people, if he resolutely accepts without complaint what comes to him, remembers the duties of his station in life, and thinks of others as much as of himself.

"Live like a hermit and work like a horse." That was Lord Eldon's motto for success. That rule of practice is indispensable whatever career one chooses. Lay the foundation of wide knowledge and catholic interests. Literature, philosophy, religion, science, music, the fine arts are all widening interests. Think greatly and widely.

In the highest order of work, no one man can know or do everything himself, and the great man of affairs always knows how and what to delegate. The strength of Cromwell, Napoleon and Bismarck lay in their grasp of great principles and their resoluteness in carrying them into execution.

All great men have been under the domination of beliefs which rested on the foundation of principle, and they were inspired to the extent that their beliefs were suffused with passion.

**James DeVon**, 227 Davenport road, Toronto, representative of the Thwing Instrument Co., Philadelphia, reports having recently sold several indicating and recording pyrometers to Canadian plants.

**Hamilton, Ont.**—It is stated that the National Steel Car Co., have received a contract from the French Government for a number of railway cars. The company are also making field kitchens for the British Government.

# PROGRESS IN NEW EQUIPMENT

## A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

### NEW HEAVY PLAIN AND UNIVERSAL MILLING MACHINE.

IN designing the larger sizes of Ohio milling machines, care has been taken to obviate shifting a heavy belt by hand, returning the table after a cut, or making long adjustments by hand, and as far as possible all other hindrances to operation efficiency.

The patent belt shifter now applied to these millers protects the operator from bodily injury, but also approaches the advantages of the single pulley type of machine by reason of instantaneous speed control. One turn of the handwheel on the machine shifts the belt from one to the next cone step, and the lever above instantly places it in the desired position on the countershaft cone. Since the power of shifting is applied extremely close to the pulley, a very tight or heavy belt yields instantly.

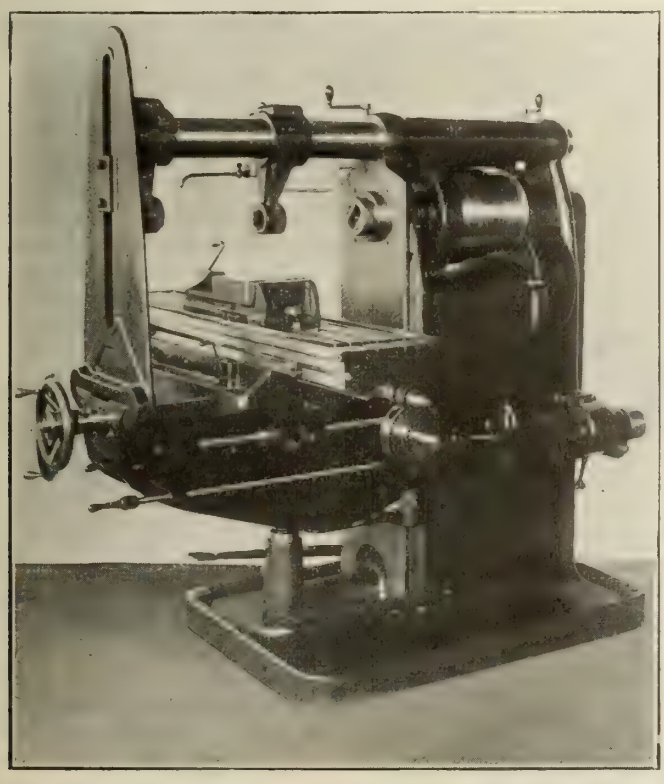
A prominent labor-saving device is to be noted in the arrangement for quick power movements of knee, saddle and table. It consists merely of a fleeting motion for whatever feed may be engaged, and is operated by depressing the treadle at either side of the machine base. These treadles are connected by means of levers and shafts to a fork which operates a clutch at the rear. This clutch is normally engaged with a gear driven from the feed box, and when shifted by means of the treadle becomes engaged with the quick speed from the counter or line shaft. Upon releasing the treadle, it automatically re-engages the adjusted feed box speed. A safety stop is provided at the limits of all movements.

Attention may be directed to the rigid construction of parts usually subject to vibration. The column, knee and table are all 13½ inches wide, which liberal proportions serve to illustrate their massiveness. The column and base are cast in one piece, with an unusually heavy front wall forming the slide for knee and the main support for spindle. The knee bearing on this slide is extended 5½ inches above top of knee, reinforcing the column at the point of greatest strain and affording a long vertical guide. This insures not only rigidity, but also an accurate vertical movement. There are no recesses nor large openings in the sides of the knee, and the top is solid front and back, being reinforced by a heavy box web less than 3 inches below centre opening, which is only length of feed plus nut, and is spanned entirely by saddle when directly over the opening. This construction permits of placing the cross screw in line with the centre of spindle.

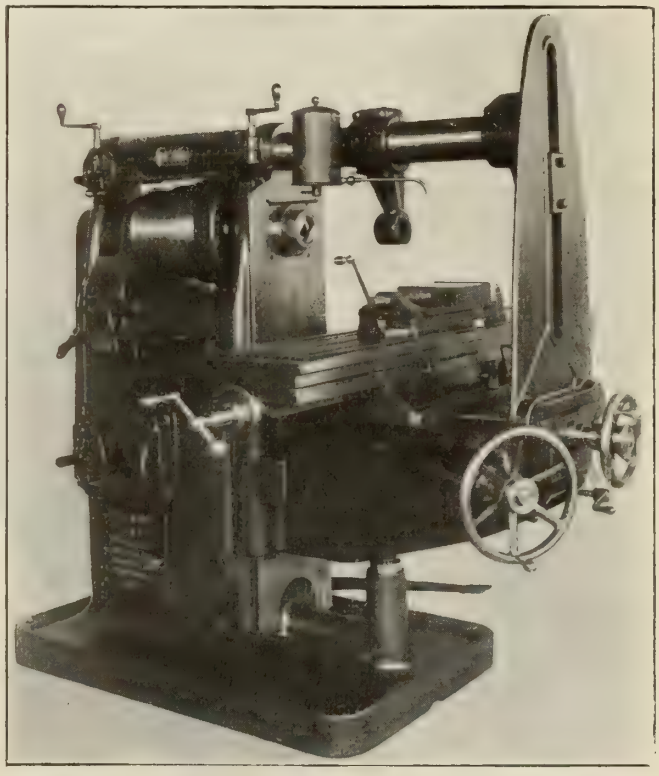
The machines give token of being powerful, a feature in this direction being the unusually large cone which affords a high belt velocity, the smallest step being 10¼ inches in diameter. To back the power, the spindle is arranged with positive drive for arbor by means of an interlocking recess and flat. It is made of a special spindle steel, runs in bronze bearings lubricated from oil wells in the column, and is adjustable for wear. The double back gears are eccentrically mounted on inside of column below the spindle, and are claimed to run noiseless under all conditions.

The feed is transmitted from spindle by roller chain to the feed box, where all changes are controlled. Only four of the sixteen rates of feed leave the box running faster than the spindle, the twelve others reducing below spindle speed. From the feed box the feed is transmitted through a universal joint and telescopic shaft to a tumbler in the knee, provided for the purpose of reversing all feeds, and from there is distributed to the table, saddle and elevating screws.

Attention is called to the manner in which power is delivered to the lead



NEW HEAVY PLAIN AND UNIVERSAL MILLING MACHINE.



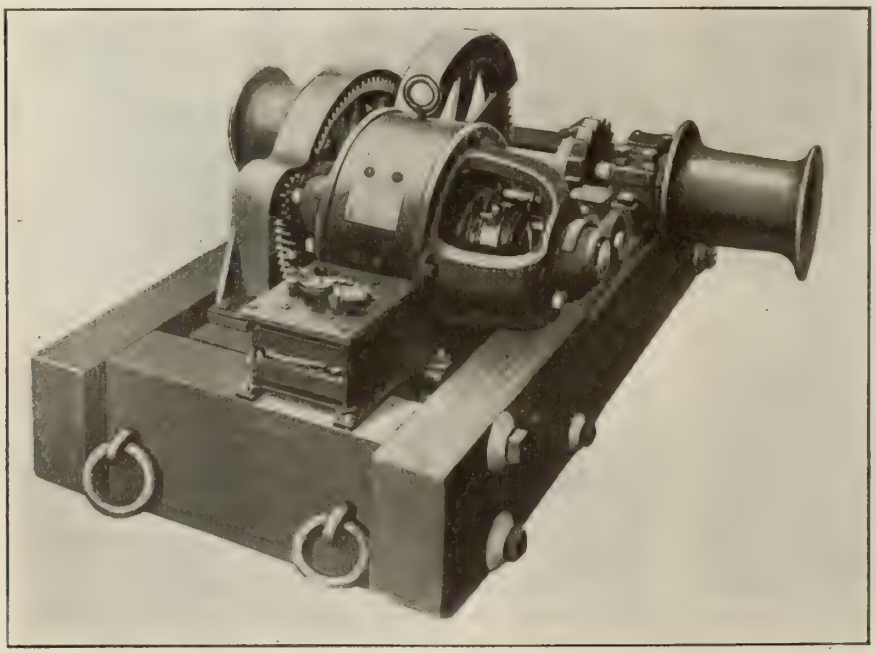
NEW HEAVY PLAIN AND UNIVERSAL MILLING MACHINE.

screw so as to avoid all torsional and radial strain. The driving gear is mounted to float upon a hardened and ground steel sleeve through which the screw passes, and is clutched into another sleeve mounted and keyed upon the screw immediately aside the lead screw nut. All control levers are centralized most conveniently for the operator.

All cutters and tools, attachments, arbors, chucks, etc., etc., are interchangeable on the No. 34 heavy plain and universal and No. 42 plain and universal Ohio machines. The plain and universal machines are identical except for the swivelling saddle. The Oesterlein Machine Co., Cincinnati, Ohio, are the manufacturers of these products.

## A PORTABLE WINCH.

THE construction of the New York Subway necessitated the building of the portable motor-driven winch shown in the accompanying illustration. It has, however, since demonstrated its usefulness in many other fields. When used for lifting material out of the subway a trestle or light frame work carrying a sheave is placed directly over the opening. The hoisting rope is passed over the sheave, given two or three turns around the friction drum, the motor started and the slack paid off as the material is hoisted. When used to assist teams in hauling loads up heavy grades, one end of the rope is fastened to the wagon tongue and the other end given several turns around the friction drum. Current is obtained from the 550-volt trolley circuit.



A PORTABLE WINCH.

The winch is manufactured in two sizes by the Dobbie Foundry & Machine Co., Niagara Falls, N.Y., the smaller outfit operating at a rope speed of 152, and the larger one at 178 feet per minute. Westinghouse Electric compound-wound type S.K. motors of 5 and 7½ h.p. respectively supply the motive power, and are very light, compact and easily portable.

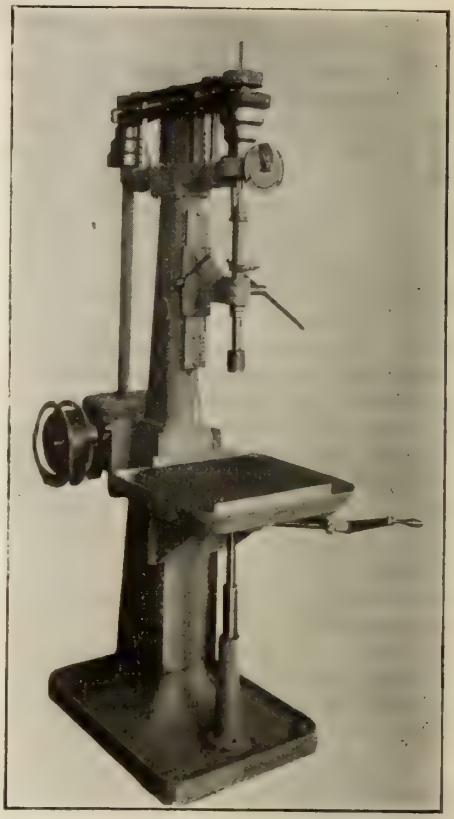
## QUICK CHANGE SPEED SENSITIVE DRILL PRESS.

THIS quick change speed sensitive drill press, when equipped with an automatic chuck, is designed so that all speed changes and changing drills of various sizes can be made without stopping the machine. The operator, it is claimed, has no excuse to leave his natural working position, either for changing speeds or drills, raising or lowering the table, or throwing the power on or off.

These machines are built in various combinations, of from one to eight spindles, inclusive. All speed changes can be made instantly. The machines have four speed changes arranged for either carbon or high-speed drills, the dial showing revolutions per minute being attached to the head in plain view, the operator simply swinging lever to the number of revolutions wanted. If desired, dials can be arranged to show the size of drill instead of the revolutions per minute. Power and speed variations are sufficient to handle high-speed drills from the smallest up to 29-32-inch diameter.

The spindle is made of a high-grade steel, accurately ground, and is provided with thrust ball bearings. It has a special effective oiling feature, and a stop collar is provided and can be set for any given depth. The spindle driving cone pulley runs on ball bearings.

One idler is fixed while the other which is held in the swinging arm, is



QUICK CHANGE SPEED SENSITIVE DRILL PRESS.

pressed by a light spring against the slack side of the belt. This pressure is sufficient to make the belt pull efficiently under drilling resistance, and automatically take up any stretch that develops through continued use. The ball bearings are high grade, and where required, a bearing with a four point contract is employed.

The table is of rigid construction, well stiffened and has an oil grove of ample capacity. Chips are easily removed, and there is wearing surface of ample length on base. The telescopic screw adds extra support under drill pressure and avoids boring any hole in the floor. A gib locks table rigidly to base. The position of crank handle enables the table to be raised or lowered, while the operator remains in his natural position.

These drill presses are designed and manufactured by the Sipp Machine Co., Paterson, N. Y.

**The Turbine Equipment Co.**, Toronto, have sold to the Swedish General Electric Co., for the Standard Chemical Co., Longford, Ont., one 3½-million-gallon De Laval single stage double suction centrifugal pump, to operate against 125 ft. total head. This pump will be direct connected to a Swedish General Electric motor.

## U.S. EXPORTATION OF ARMS AND MUNITIONS OF WAR.

WHATEVER other opinion all or any of the belligerent nations may hold as to the determination of the United States Government to refrain from participation in hostilities, it is abundantly evident that there is absolutely no ground for the claims of Germany that our neighbors are differentiating in the matter of supplies to the detriment of that country in its warfare against the Allies. Through its Government we believe the United States to be giving a square deal to all of the warring nations, even in spite of the fact that its sympathies cradled and expressed are towards ourselves.

The United States, however, in its multitudinous business and manufacturing activities does not now any more than in former times concern itself about delivery, beyond that expressed by F.O.B. It has not in recent years tried very seriously to combine ocean transportation of its products with that of their manufacture, but rightly or wrongly has left the carrying feature to the care of the buyer or somebody acting for the latter in that capacity. Germany, like most of the other European nations, has all along been cognizant of such conditions existing, and, in her wisdom shall we say, provided German bottoms to transport her own as well as the requirements of others.

So far as the United States is concerned, conditions have not changed, except it be that on account of the now long-time prevailing business depression she is more than ever willing to manufacture and dispose of her wares. Getting necessities food and munitions of war to the Fatherland is not, however, the picnic it used to be. There are lions in the way and to cage these the United States is beseeched, or, failing that, to at least quit feeding them.

Much loose talk was indulged in during the early weeks of the war relative to the shrewdness and business capacity of the German people, even to the extent of crediting Kaiser William as being the genesis and embodiment of these attributes. Without in any way attempting to flatter America's business men and certainly with no idea of trying to detract from the much lauded sagacity of the Teuton, it may confidently be asserted that the latter have at no time been in the same class as the former, and while in normal times the gulf distinguishing the one from the other was on superficial observation perhaps less apparent, there is to-day unmistakable evidence as to who is and of course always was "top-dog."

The difficulty that Germany experiences in getting supplies from the United States is a real one, and we doubt not that her complaint on account of the difficulty is equally real. She took at least a sporting chance of winning by embarking on this war, but she gives abundant evidence that she lacks the sporting spirit of a good loser, and no better exemplification of her misrepresented shrewdness and unbalanced business capacity is to be found than when in the face of the silent economic pressure exerted by the naval and military forces of the Allies, she begins to whine.

The clean-up now being prepared for and concurrently brought measurably nearer is much too comprehensive however in its scope to be arrested by any species of complaint. Arms and munitions of war are to be had ad lib. in the United States by any of the belligerents, and their orders will, we are sure, continue to be received with open arms. Bearing them home, however, touches each purchaser individually and is no affair of the seller.

INSTEAD of turning swords into plow-shares, the Germans are melting church bells to make cartridges. Needless to add, they are stealing the bells.

• • •

GERMANY need not plead the "Baby Act" because her navy cannot compete with or is at least afraid to meet that of Great Britain in a straight up and down tussle.

• • •

IT is a perilous business—this ready condemnation of other people, and invariably indicates tactlessness, stupidity and gross ignorance. In its own little world, it however betokens smartness.

# The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

**Montreal, Que., March 8, 1915.**—The past week has witnessed several events of interest to machinery manufacturers in general. Business, however, has been very much as usual, although on every hand there is a decidedly improved outlook. In the death of Andrew J. Darling, a member of the well-known engineering firm of Darling Bros., Montreal loses one of its pioneer manufacturers, Mussens, Ltd., on Friday last placed their business in the hands of a liquidator, but it is understood that the assets on the books exceed the liabilities by about a quarter of a million dollars. These assets are made up largely of a huge stock of machinery.

**The Steel Market.**

Canadian mills are not suffering greatly from the lack of orders. The Dominion Steel & Coal Co. have large European contracts to fill, while the Nova Scotia Steel & Coal Co. have large shell contracts. The Algoma Steel Corporation have closed further orders with American railways. The latest order was placed by the Illinois Central Railway and is reported to be in the neighborhood of 25,000 tons.

With regard to structural steel, little can be said, as business continues very quiet. In tin plate; wire products and steel pipe, conditions are rather better, but in merchant mill products the mar-

ket is only fair. Were the railways to loosen up and permanent investment be resumed, the total business would be far from unsatisfactory. However, inquiries are coming in regularly and in increased volume.

### Pig Iron.

Pig iron markets are as usual very quiet, there being little or no business passing. In spite of the existing depression, however, the February figures of the Dominion Steel & Coal Co. show that their pig iron production has materially increased.

### Machine Tools.

Business remains very quiet in machine tools, and conditions from week to week seem to change little. The fact that Mussens, Ltd., have placed their affairs in the hands of the liquidator caused, of course, a great deal of surprise, but as their books show assets largely in excess of liabilities, the position of the firm may be regarded as financially sound.

The supply business continues to be of considerable importance, being quite a large factor in the operations of several houses.

### Metals.

The copper situation has not changed a great deal during the week. There was recently shipped from Baltimore on two steamers the largest single consignment of copper that ever went from America to Europe. The shipment consisted of 15,080,000 lb., and was destined for Havre, France. Prices are fairly firm.

The price of tin is up ten cents a lb. Spot tin is almost unobtainable and no relief is in sight until advices are received of definite shipments from London. The unsettled condition of ocean shipping is largely responsible for the increased price.

Spelter is also up one cent a pound. Briefly stated, the spelter situation is as follows: Prices higher, early deliveries scarcer than ever.

The lead situation can be summed up as follows: Quiet but firm. A slight advance in the price is reported and sales are about normal.

Antimony took another jump up of one cent a pound. There is no relief in sight.

Aluminum prices are the same and no changes are reported, although a fair amount of business is passing.

---

**Toronto, Ont., March 9, 1915.**—There is a somewhat improved tone in business circles this week and a more optimistic spirit is prevalent. Industrial conditions, however, are considerably under normal, but with the approach of spring the outlook will tend to improve. Further orders for military equipment and supplies continue to be placed and consequently a number of factories have plenty of work on hand. The stir caused by the new tariff is subsiding and conditions are being gradually adjusted. Prices of some lines have yet to be revised, principally on Canadian-made products; imported goods in nearly all cases having already advanced.

### Steel Market.

There is no appreciable change in the condition of the iron and steel trade. Ordinary business is dull but the demand for steel for shells is active and the plants making forgings are busy. The building trade is quiet, and indications do not point to any material improvement for some time. The Algoma Steel Company has been successful recently in obtaining some interesting orders for rails from American railroads. Although the price is understood to be low, the industry will be stimulated and the mills kept in operation. There have been no price changes this week. Quotations have stiffened on Pittsburgh bars and shapes, but shipments are still being made at $1.10 base. Prices, however, covering shipments after April 1, have advanced 2½ to 5c per 100 pounds. There have been no further changes in domestic products since last week.

### Pig Iron.

The market is dull and without interest. The advance in prices has had a tendency to further depress business.

### Machine Tools.

Machine tool dealers here have been busy this week preparing their tenders for tools and equipment for the new Technical School. There has been less activity as regards shell-making machinery, as many firms working on shell contracts have placed their orders. Difficulty is being experienced in some cases in obtaining satisfactory deliveries as the makers of these special machines, especially those located in the States, are also working on large orders from Europe for similar tools. When orders for lyddite and the larger calibre shells are distributed there will be further activity in the trade as the equipment for these varies in some respects from that required for the 15 and 18-pound shell.

### Supplies.

The demand for machine shop supplies is showing some improvement. There has been no further change in prices except in Manila and transmission ropes which have advanced ½c per pound. An advance in the price of brass goods is confidently expected while leather belting may also go up.

### Old Material.

The market is dull and volume of business continues light. Copper and brass scrap have advanced again, quotations being ½c per pound higher. The new prices are as follows: Crucible copper, heavy and wire, 11½c per pound; brass clippings, 9½c, and scrap zinc 7c per pound.

### Metals.

Although business has improved during the week it is still under normal. All markets are very firm, due entirely to strength in London. This is reflected principally in tin, which has jumped up 6c per pound, while spelter and antimony have also advanced ¾c and ½c per pound respectively. Other prices are unchanged.

Tin is strong in London and the market continues excited over the shipping situation at that port. Tin is quoted locally at 50c per pound.

Copper is firm and there is no change in the export situation. Lake copper is being quoted at 16½c per pound.

Spelter has advanced ¾c per pound. There is no change in the spelter situation and supplies are difficult to obtain. The price is unprecedented and indications point to still higher figures. Present quotation is 12c per pound.

Lead is firm at 5¾c per pound. Antimony is strong at an advance of ½c, being now quoted at 21c per pound. Aluminum is unchanged at 23½c per pound.

## MUSSENS LIMITED IN LIQUIDATION.

MUSSENS LIMITED, dealers in railway, mining and contractors' supplies, were on Friday last placed in liquidation on petition of W. H. C. Mussen, the step being taken as a direct result of the depression recently experienced in this particular line of business. The liabilities are in the neighborhood of $300,000, and the assets, comprising merchandise on hand, realty holdings in Montreal and Winnipeg, open accounts, bills receivable, are stated by Mr. Mussen to be in the neighborhood of $550,000, or approximately $250,000 in excess of the liabilities. It is understood that an endeavor will be made on behalf of the creditors to have the business continued under the direction of the liquidator to be appointed. John J. Robson has been named provisional liquidator, until such time as the creditors hold a meeting and determine upon the nomination of the liquidator.

"The whole trouble," Mr. Mussen is reported as saying, "has been brought about by the difficulty experienced in getting in collections and in reducing the rather heavy stock on hand. In this particular we have simply fallen victims to the depression which has been met with in our particular line of business.

However, if the matter is properly handled, there need be no fear at all for the creditors. We have in book assets a surplus over liabilities of about a quarter of a million dollars.

"The stock which we carry is not of the kind that can be thrown upon the market broadcast, at any time—like, for instance, groceries, dry goods, etc. Even under normal business conditions our slack months are November, December, January and February, when heavy construction work is practically at a standstill. It is just at the present time of the year, under normal conditions, that our business begins to look up. Though the present is a rather abnormal time, our business has, as a matter of fact, shown a disposition to improve to an appreciable extent, and we have already received many inquiries regarding supplies, and have booked quite a few orders for delivery later in the season."

On the question of reorganization, Mr. Mussen, it appears is against such a proposal, unless it were one under which all the creditors would receive 100 cents on the dollar.

## BRITISH IMPORTS FROM CANADA.

BRITISH trade returns for the year 1914, including five months of the war, received by the Department of Trade and Commerce, show that in spite of abnormal conditions there was a considerable increase in Canada's exports to Great Britain as compared with 1913. For the full year, Canadian produce sent to Great Britain was $4,652,000 greater than in 1913, and $22,690,000 greater than in 1912. For the final quarter of last year, the British imports from Canada were approximately nine and one-half millions in excess of those of the last quarter of 1913, principally due to the large trade in foodstuffs and other supplies bought from Canada consequent upon the war.

British exports to Canada, however show a marked decline, especially during the last half of the year. The decrease for the six months in comparison with the corresponding period of 1913 was $20,168,000. For the full year, Canada's purchases from Great Britain were $32,654,000 less than in 1913.

The increase in purchases from Canada last year are the more important when it is borne in mind that Great Britain's total imports from British possessions last year were about $17,200,000 less than in 1913.

**Redcliff, Alta.**—The Ornamental Ironworks and the Redcliff Rolling Mills have started operations after being closed some time.

**The Turbine Equipment Co.**, Toronto, have received an order from the Cobalt Reduction Co., Cobalt, Ont., for two 1 million-gallon De Laval electrically driven centrifugal pumps, each to operate against 75 lbs. pressure. They have also sold 1 special De Laval 6-in. motor driven stock pump to the J. R. Booth Co., Ottawa.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

# INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

## Engineering

**Waterloo, Ont.**—A new heating system will be installed in the Central school.

**Owen Sound, Ont.**—Wm. Kennedy & Sons Co., have received a contract for 25,000 shrapnel shells.

**Walkerville, Ont**—Fire at the Canadian Bridge Co. plant on March 4, did damage to the extent of about $1,000.

**Port Colborne, Ont.**—It is announced that the Canadian Furnace Co., may blow in their furnace sometime this month.

**St. Thomas, Ont.**—W. H. Heard, of the Spramotor Works, at London, has purchased a controlling interest in the C. Norsworthy Co., known as the Red Foundry.

**The Pas, Man.**—The estimated cost of the lighting and heating plant of The Pas terminals of the Hudson Bay Railway is $35,000. The plans for the heating and lighting plant were drawn by W. E. Cox, of Winnipeg.

**London, Ont.**—General Manager Glaubitz of the Utilities Commission, who resigns his official position on May 1, has about completed the organization of a factory for the manufacture of electrical supplies. It is stated that the new factory will at the outset employ 100 hands.

**Grimsby, Ont.**—A permit has been issued to the Imperial Oil Co., of Toronto, to erect two large steel oil tanks, a pump house and a pipe line on the G. T. R. property on Robinson street, north, on the south side of the G. T. R. tracks. The pipe line will be two hundred and fifty feet long.

**Winnipeg, Man.**—A large contract for shrapnel shells, to be made in Winnipeg, was closed a few days ago. The work will be divided among the following firms:—The Manitoba Bridge & Iron Works, Dominion Bridge Co., Vulcan Iron Works, Western Steel & Iron Works, and the machine shops of the C. P. R., C. N. R. and G. T. P.

**Guelph, Ont.**—Another new industry has been secured for this city. The name of the new concern is the George B. Jackson Co. It has a large factory in operation at Westminster, Maryland, manufacturing all sorts of railway signals, torpedoes and fuses, and has been doing a large business in all parts of Canada. The new 7½ per cent. duty which has just been put on these goods by the Dominion Government, however, interferes with the Canadian business, and the company have decided to manufacture in Canada, selecting Guelph as its location. It is taking over the factory on Alice Street, formerly used as an axle factory, and later as a brass foundry, and will make alterations to suit its requirements.

## Electrical

**Delaware, Ont.**—Hydro current was inaugurated here on Feb. 27.

**Newmarket, Ont.**—Equipment will be required for extensions to the street lighting system.

**London, Ont.**—The town council are in the market for electrical transmission equipment to cost $62,000.

**Sandwich, Ont.** — The Provincial Hydro-Electric Commission will install a street lighting system here.

**Toronto, Ont.**—The Toronto Hydro-Electric Commission propose to substitute 1,000-watt hydrogen lamps for the present cluster lamps in the downtown district.

**St. Mary's, Ont.**—It is proposed to install a new street lighting system and the necessary equipment, such as transformers, meters, wire, poles, etc., will be required.

**St. Thomas, Ont.**—The village of Dutton has carried by large majorities by-laws authorizing a contract with the Hydro-electric Power Commission for a supply of power, and endorsing an expenditure of $10,000 for the inauguration of the system.

**Walkerton, Ont.**—The Formosa Electric Light Co., has been formed and purposes running a line to connect with the Walkerton Light Co. wires at Mildmay. The sum of $5,000 has been subscribed and the following officers appointed: President, F. A. Heinz; secretary-treasurer, G. G. Benninger; directors, F. McCue, A. Opperman, J. H. Shefler.

## Municipal

**Saskatoon, Sask.**—A water meter will probably be purchased by the city in connection with the water supply to Sutherland village.

**Moncton, N.B.**—The city council will purchase a number of water meters. J. Edington is city engineer.

**Beverley, Alta.**—The town council contemplate installing a waterworks and electric lighting system. The cost is estimated at $75,000. H. E. Read, engineer.

**Edmonton, Alta.**—A by-law submitted to the ratepayers authorizing the expenditure of $36,000 to take over the Viking gas well was defeated by a majority of over 3 to 1.

**Lindsay, Ont.**—The ratepayers on March 2, declared against rendering any assistance to the Canadian Boving Co., by way of guaranteeing bonds to the extent of $30,000.

**Stratford, Ont.**—The ratepayers on March 5 voted 2 to 1 in favor of the construction of a new main sewer at a cost of $72,000, as ordered by the Provincial Board of Health.

**Kingston, Ont.**—The city council has adopted the report of the Board of Works for reorganization of the city engineer's department. The engineer was reappointed, but the staff was reduced.

**Toronto, Ont.**—Work on the new Ransom filter plant at the Island will be resumed in the near future. The Ver Mehr Co., and William Cowlin Co. have the contract for constructing the plant.

**Peterboro, Ont.**—The city will pay $154,615 and interest for the lighting plant of the Peterboro Light & Power Co., expropriated last October, and will also pay the costs of the recent arbitration, which it is believed will be $10,000 or more.

**Embro, Ont.**—A committee outside of the council has been appointed to have charge of the local hydro system. This committee will consist of Reeve H. B. Atkinson, Dr. Green and G. M. Creighton, with C. E. McCawley as secretary-treasurer.

**Vancouver, B C.**—Fire Chief Carlisle has recommended purchase of auto gasoline pump at $12,000; auto hose wagon at $7,400; auto water tower at $17,500, and that $38,100 be voted for purchase of new apparatus. City Clerk, W. McQueen.

**Brantford, Ont.**—A by-law will probably be voted on to sanction an issue of $30,000 of debentures. The money will

be expended on an addition 23 ft. x 45 ft., to the sub-station and also the installation of additional equipment for handling 3,000 h. p.

**Newmarket, Ont.**—The two by-laws recently ratified by the rate-payers authorizing the Council to enter into a contract with the York Radial for a supply of power and also to raise the sum of $15,000 by debentures, were given the third readings at a special session of the Town Council here last Monday.

**Toronto, Ont.**—Fire Department's estimates for 1915 include the following:—Special wire and cable, $1,132; 60 fire alarm boxes, $60,000; 4 tractors for service trucks, $26,000; 1 tractor or engine, $8,775; 1 tractor for aerial truck, $8,775; 1 combination chemical and hose truck, $6,000; 7,000 ft. of 2½-in. hose $7,000.

## General Industrial

**Welland, Ont.**—T. B. Allan, of Toronto, will probably establish a factory here for making emery.

**Preston, Ont.**—It is reported that the Board of Trade has concluded negotiations with a company who propose taking over the vacant building erected for the Anchor Bed Co.

**Cornwall, Ont.**—Frank R. White of New York, formerly of Cornwall, has been in town with a view to interesting local people in the establishment of a branch of the American Master Organ Co. of New York in Cornwall.

**Vancouver, B.C.**—The Imperial Oil Co. announces the completion of its new refinery on Burrard Inlet, near Port Moody. The most modern equipment has been installed for the manufacture of products, of petroleum and the refining of that natural product itself.

**Medicine Hat, Alta.**—The Creelman Contracting Co., has taken over a big interest in the Purmal Brick Co., and in future this plant will be known as the Gas City Brick Co. A. G. Creelman, of Calgary, is the head of the new brick concern, and Geo. E. Hughes is secretary.

**Montreal, Que.**—H. E. Mann, engineer and gas expert, and J. S. Norris, manager of the Montreal Light, Heat & Power Co., paid a visit to the wells of the Canadian Natural Gas Co., at St. Barnaby, some eight miles from St. Hyacinthe, on Feb. 27. Fifteen wells are projected. Ten of these are to be ready by midsummer and if the results are satisfactory, as the promoters of the company expect, arrangements will be made for the laying of a pipe line to Montreal, a little over thirty miles, bringing the Montreal market, as well as that of St. Hyacinthe and other surrounding towns within ready reach.

## Tenders

**Hamilton, Ont.**—Tenders will be received up to March 18 by the Board of Control for 3,160 feet of 36-in. cast-iron pipe and specials. Specifications and forms of tender may be obtained from A. F. Macallum, city engineer.

**Winnipeg, Man.**—Tenders addressed to the chairman, Board of Control, will be received up to Monday, March 22, 1915, for the supply of storage batteries for the new Central Fire Alarm Office equipment. Specifications may be obtained at the office of the City Electrician, Olafsen Block, Winnipeg. M. Peterson, secretary.

**AID BELGIUM OR KEEP QUIET.**

**"Unless neutral nations are prepared to assist in throwing the Germans out of Belgium, no suggestions from them in the matter of preventing the further devastation of that country are wanted," said Sir Edward Grey, the Foreign Secretary, in the British House of Commons on March 4. The Foreign Secretary's statement was made in response to an inquiry from Frederick W. Jowett as to whether the Government was willing to invite suggestions from neutrals with a view to avoiding the further devastation of Belgium by the great powers which are contending for its mastery. The only solution of this question," Sir Edward continued, "is the evacuation of Belgian territory by German troops, the restoration of her independence and reparation for the wrong done her. Unless neutral powers are prepared to assist in securing that solution, I don't see what could be gained by the course suggested."**

**Port Hope, Ont.**—Tenders will be received by the secretary of the Board of Water Commissioners until March 15 for the following work and materials:—Contract 3—Low-lift centrifugal pumps, motors, oil engine, piping and erection of same. 4—Venturi tubes, loss of head gauges, elevation gauges. 5—The construction of four slow sand filters, pump house and pure water reservoir. 6—Cast iron pipe and specials. 7—Valves and valve boxes. Plans may be seen and specifications obtained at the office of the engineers, F. W. Thorold Co., Ltd., 2 Toronto street, Toronto, Ont.

**Fredericton, N.B.**—Tenders will be received at the Department of Public Works, Fredericton, until March 31, 1915, for constructing the steel superstructure of a new bridge, to take the place of the present wooden highway bridge at Moncton over the Petitcodiac River; one through fixed riveted steel truss span of 355 feet from centre to centre of end bearings; four through fixed riveted steel truss spans of 261 ft., 6 in. from centre to centre of end bearings, according to plans and specifications to be seen at the Public Works Department, Fredericton, N.B. John Morrissy, Minister of Public Works.

**Ottawa, Ont.**—Tenders will be received until Thursday, March 18, 1915, for the construction of the superstructures of two (2) steel through truss highway bridges and of one (1) steel single leaf highway Strauss Trunnion Bascule bridge over the Cataraqui River at Kingston, Ont. Plans and forms of contract can be seen and specification and forms of tender obtained at the Department of Public Works, Ottawa, and at the offices of the District Engineers, Confederation Life Building, Toronto, Ont.; Shaughnessy Building, Montreal, Que., and on application to the postmasters at Hamilton, Ont., and Kingston, Ont.

**Vancouver, B.C.**—Tenders will be received up till March 31, for the supply of the following articles for the use of the B.C. dredging fleet at Vancouver, B.C., for 12 months ending March 31, 1916:—Hardware; packings; Manila rope; wire rope; chain; steam pipe, valves and fittings; oils and greases; paint, paint oils, etc.; hose; brooms and brushes; steel castings. Forms of tender may be obtained at the office of G. B. Hughes, district engineer, Victoria, B.C.; at the office of C. C. Worsfold, district engineer, New Westminster, B.C.; and at the office of J. L. Nelson, supt. of dredges, 614-18 Birks Building, Vancouver, B.C.

**Ottawa, Ont.**—Tenders will be received at this office until Wednesday, April 7, 1915, for the construction of one new chain of buckets, tumblers, together with spare parts, for dredge "Mastodon." Plans, specification and form of contract can be seen and forms of tender obtained at the Department of Public Works, Ottawa, and at the offices of A. Kastella, Esq., mechanical superintendent, Birks Building, Ottawa, Ont.; J. L. Nelson, Esq., supt. of dredges, Vancouver, B.C.; G. B. Hughes, Esq., district engineer, Victoria, B.C.; C. C. Worsfold, Esq., district engineer, New Westminster, B.C.; F. Y. Harcourt, Esq., district engineer, Port Arthur, Ont.; J. M. Wilson, Esq., acting district engineer,

Toronto, Ont., and A. E. Dubuc, Esq., district engineer, Montreal, Que.

## Contracts Awarded

**Toronto, Ont.**—The Queen City Foundry Co., Toronto, has been awarded a contract by the Board of Control, for the supply of cast iron special castings at a cost of $2,145.

**Brantford, Ont.**—The contracts for three new statoins, at Port Dover, Simcoe and Waterford, for the Lake Erie & Northern Railway, have been let to P. H. Secord & Sons of this city. The contract price is $6,000 each.

**Montreal, Que.**—An order from the Greater Winnipeg Waterways Co. has been received by the Canadian Car and Foundry Co. The new business calls for the manufacture of forty 50-ton dump cars, as well as twelve smaller dump cars. The equipment will be made at the local plants and is valued at about $70,000.

## Trade Gossip

**The Algoma Steel Corporation**, of Sault Ste. Marie, Ont., has secured an order for 25,000 tons of standard section rails from the Illinois Central Railway.

**The Keeton Motor Car Co.**, Brantford, Ont., will build a number of motor cars for shipment to England and France. The president, F. M. Keeton recently returned from Europe.

**French Government Orders.**—Orders for artillery ammunition and harness for the French Government amounting to over five million dollars have been placed with Canada through the High Commissioner's office in London.

**Elmira, Ont.**—The Board of Trade elected officers as follows: President, M. L. Weber; vice-president, Geo. Klinck; secretary, W. L. Badley; treasurer, C. P. Ruppel; council, A. Werner, W. Cleghorn, A. E. Edwards, T. F. Shurley, O. H. Vogt, J. A. Schroder. The secretary's report showed the membership to be 110.

**Dominion Steel Feb. Output.**—February figures of the Dominion Steel & Coal Co. are more encouraging than was expected. The output of pig iron was larger than in February of 1914, and showed a considerable increase upon January of this year. The coal production in February was 97,000 tons larger than in January. An increase in rail production over January is particularly interesting. In February of 1914 the pig iron produced was 18,482 tons, ingots 23,960 tons, and coal 347,356 tons. The record for the first two months of this year follows:—

| | Feb., 1915. Tons. | Jan., 1915. Tons. |
|---|---|---|
| Pig iron ..... | 20,621 | 17,856 |
| Steel ingots ..... | 23,430 | 20,189 |
| Rails ..... ..... | 9,201 | 3,329 |
| Bars ..... ..... | 206 | 1,374 |
| Wire rods ..... | 2,583 | 2,066 |
| Wire and wire products .... ..... | 1,995 | 1,368 |
| Coal ..... .... | 312,259 | 215,100 |

It will be noticed that only in the production of bars was there a falling off in February from January of this year.

## Building Notes

**Red Deer, Alta.**—The Dominion Government will erect a public building here to cost $34,000.

**MacLeod, Alta.**—The Dominion Government will erect a public building here estimated to cost $25,000.

**Merritt, B.C.**—The Dominion Government propose to spend $25,000 on a post office and public building here.

**Bassano, Alta.**—A public building will be erected here by the Dominion Government. Estimated cost $15,000.

**Brantford, Ont.**—A building permit has been issued to the Slingsby Manufacturing Co. for a new boilerhouse to cost $1,000.

**Renfrew, Ont.**—A committee has been appointed to make application to the Carnegie Corporation for the necessary money to build a library.

**Montreal, Que.**—Work will begin shortly on the new Bancroft school. Nobbs & Hyde are the architects and A. F. Byers & Co., contractors.

**Calgary, Alta.**—The Dominion Government estimates for public building in Calgary include, customs warehouse, $15,000; drill hall, $100,000; post office, $110,000.

**Edmonton, Alta**—The Federal estimates provide for the following: Post office addition, $100,000; customs examining warehouse, $75,000; drill hall, $200,000.

**Toronto, Ont.**—City Architect Pearse has granted a permit for an $80,000 brick factory, five storeys high, to be erected by Samuel and L. S. Yolles at 468 Wellington street west. It will be about 70 feet high.

**Toronto, Ont.**—The city architect's department has issued a building permit to R. C. Bustard for the erection of a six-storey terra cotta office building, costing $29,000, at the east side of Yonge street near Isabella street.

**Windsor, N.S.**—On the site where the Acadia Collegiate Academy formerly stood, will be erected a building of stone, to cost $40,000. The committee were instructed to secure plans, and just as soon as financial arrangements are completed, the building will be begun.

**Winnipeg, Man.**—R. Bingham, of the firm of Bingham & Drahonnet, of this city, states that he has completed all arrangements for the erection of a modern office building to cost $125,000 on the north-west corner of Portage and Garry. The detailed plans for the new edifice are now being prepared by Woodman & Carey.

**Walkerville, Ont.**—Tenders are being called for by the architects, G. Jacques & Co., for the construction of the new $50,000 separate school building to be erected on Niagara street. The structure will be 80 x 123 feet. In addition to the most modern heating and ventilating systems, a vacuum cleaning system will be installed in the new school.

**Guelph, Ont**—The Toronto Suburban Railway Co. has taken out a permit from the office of the city engineer for the erection of a new transformer station. This station will be erected on Bay street, and will cost $4,500. It is expected that hydro-electric power will be used. Architect Briggs of Toronto has prepared the plans and he will at once ask for tenders.

**Montreal, Que**—After the tenders of eleven firms for the construction of the new civic library on Sherbrooke street, at prices ranging from $442,000 to $534,000, were opened at the Board of Control meeting on Feb. 27, they were all referred to Alcide Chausse, building inspector, and to E. Payette, architect, for a report. The lowest tender for the construction of the building, according to the specifications, was given by John Quinlan & Co., at $466,000, and the highest by Alfred Pion at $534,000.

## Wood-Working

**Welland, Ont.** It is announced that a furniture factory will be established here. H. L. Halter is interested.

**New Westminster, B.C.**—Work has been started on shingle mill for The Mackie Mill & Mercantile Co., Gettysburg, Wash.

**Kingston, Ont.**—A fire destroyed the sawmill of S. Anglin & Co. on Feb. 16. The damage is $15,000, partly insured. Spontaneous combustion was the cause of the blaze.

**Port Dover, Ont.**—The Port Dover Planing Mills have decided to make extensions to their plant. An addition 20

ft. x 42 ft. will be built, also a drying kiln having a capacity of 40,000 feet.

**Bancroft, B. C.** — McLean, Strudwick & Delyea have secured a site from Fair & Mullett, adjoining the electric light plant, and are already at work on the foundation for a planing mill. They will use water power.

**Lunenburg, N.S.**—Fire broke out in the saw and planing mill of Smith & Rhuland's shipyard on Feb. 24. The building and machinery were badly damaged by fire and water. There was no insurance.

## Railways-Bridges

**Toronto, Ont.**—Tenders will be called shortly for the building of a bridge over Merton street.

**Windsor, Ont.**—The city is interested in the hydro-radials project, and a campaign will be started to further the scheme.

**Campbellford, Ont.**—The Dickson Bridge Works Co. have secured the contract for erecting a new bridge on the Intercolonial Railway, their tender being about $14,000.

**Prince George, B.C.**—The G. T. P. has started excavations for two big oil tanks here to hold 35,000 gallons each. It is stated the railway will soon use oil on its engines between Edmonton and Prince Rupert.

**Calgary, Alta.**—The ratepayers having turned down a by-law to raise the sum of $165,000 for the construction with concrete of the Louise Bridge, it is now proposed to put up a steel structure similar to the one already existing, on the same abutments and piers, at an estimated cost of $40,000.

**Ottawa, Ont.**—The application of the C. N. Q. R. for authority to construct sidings across Stadacona and Marlborough streets, in Hochelaga ward, Montreal, has been granted by the Railway Commission. The railway desires the crossings as part of an extension of its Moreau street yards.

**Kincardine, Ont.**—The delegation, consisting of J. J. Hunter, Dr. Armitage, Thomas Reed, which was sent by the town to interview the Provincial Government re the possibility of getting a radial road to go from Sarnia to Owen Sound, got a promise that the Government will take the subject into consideration.

**Grimsby, Ont.**—It is reported that the Grand Trunk is considering building a railway from Grimsby to Port Maitland on the West side of the Grand river, making a short cut from Toronto and Hamilton to Lake Erie, to share in the coal trade and other important manufacturing which is expected to be located there.

**Toronto, Ont.**—Mayor Church has announced that twenty-five members of the Ontario Hydro-Electric Radial Railway Union would go to Ottawa this week to ask the Dominion Government to grant a subsidy of $6,400 a mile to the hydro radials. Sir Adam Beck, Mayor Church and J. W. Lyon, of Guelph, will form part of the deputation.

**C.P.R. Extensions.**—Grant Hall, vice-president of the C. P. R., in charge of western lines, states that the company has taken over since 1908 more than 3,000 miles of new track. In the same period 789 miles of second track has been put in operation; and the sections of the railway between Macleod and Lethbridge and between Field and Hector, have been rebuilt. In addition to all this, the company's terminals have all been practically rebuilt during the period mentioned. Mr. Hall thought that the Rogers Pass tunnel would be finished in two years. The company, Mr. Hall stated, contemplated operating the completed section of the Kettle Valley road this summer—a service to the coast being afforded by way of Midway, Penticton, Princeton, Merrit and Spence's Bridge, from Nelson. Mr. Hall referred to the Kootenay Central Railway which now affords an important link between the prairie provinces and British Columbia — joining the main line at Golden.

### ALLIES PURCHASING AGENTS.

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**British—Col. A. G. Barton and A. C. Billing, Ritz Carlton Hotel, Montreal.**

**French—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.**

**Russian — Messrs. S. Ruperti and Aiekieff, care Military Attache, Russian Embassy, Washington, D.C.**

## Personal

**J. D. McBeath**, assistant engineer of Medicine Hat, Alta., has sent in his resignation.

**R. O. Wynne-Roberts**, consulting engineer to the city of Regina, will resign at the end of May.

**William Snider**, vice-president of the Waterloo Mfg. Co., Waterloo, Ont., died on March 8, aged 68.

**A. J. McGee**, secretary of the Timiskaming & Northern Ontario Railway Commission, passed away at Toronto, on March 1 at the age of 38.

**George T. Merwin** has been made general sales manager of the Canadian Car & Foundry Co., Montreal. He was formerly with the W. W. Butler Co., Montreal.

**J. Orr Callaghan**, general manager of the Steel Company of Canada, has returned to Hamilton after an inspection of the company's new plant at Fort William, Ont.

**Captain Murdock McLean**, of Duluth, died here on March 4, of heart trouble. He was born in Kincardine, Ont., 60 years ago and spent most of his marine career in Canadian fleets.

**Mining Institute Officers.**—The Canadian Mining Institute ,at their annual meeting last week, elected the following officers:—President, G. G. S. Lindsay, Toronto. Vice-presidents—Thomas Cantley, New Glasgow, N.S., and A. Cole, Cobalt, Ont. Council—Prof. Buker, Kingston; John Bell, Montreal; R. W. Brock, Vancouver; T. Denny, Quebec; D. A .Dunlop, Toronto; M. B. Gordon, Cobalt, Ont.; S. S. Mackenzie, Ottawa; D. T. McDougall, Sydney, N.S.; J. T. Stirling, Edmonton, and A. F. Young, Toronto.

**Arthur J. Darling**, president of Darling Bros., Ltd., engineers and manufacturers, Montreal, died on March 5, at his residence, 73 St. Luke Street, at the age of 52. He had been in ill health, but his death was not expected. He was the son of the late Thomas Darling, an accountant. Mr. Darling belonged to the Montreal Curling Club, and was president of the Whitlock Golf Club, Hudson Heights, of which he was one of the founders. He is survived by his widow and three young children, two sons and one daughter.

**Lieut.-Col. Lacey R. Johnson**, general superintendent of the C. P. R. Angus Shops District, has been appointed to the position of general welfare agent, to co-operate in the development of such organizations as the St. John's Ambulance Association, the Safety First movement, the Railroad Y.M.C.A., and Athletic Associations, amongst the employees of the C. P. R. Mr. Johnson, who joined the C. P. R. service in 1882, and has had a wide experience in rail-

way shops as foreman, master mechanic, and superintendent, was born at Abingdon, Berkshire, England, June 22, 1885. He has been general superintendent of the Angus Shops, Montreal, since July 1, 1912.

## Refrigeration

**Quebec, Que.**—A new abattoir may be built by the Quebec Abattoir Co.

**Calgary, Alta.**—H. Van Buskirk, manager of P. Burns & Co., says his firm will have a cold storage plant at Rossland, B.C.

**New Liskeard, Ont.**—A committee has been formed among residents of this district to make preliminary arrangements for establishing a creamery. W. A. Houser, of Earlton, is chairman.

**Regina, Sask.**—It is announced that prominent Regina financiers are at present interested in the organization of a meat packing plant. It is proposed to organize a company capitalized at $20,000.

**Windsor, Ont.**—Contracts have been awarded to the Huettner, Creamer Co. of Detroit to erect a 20-ton artificial ice plant for the Bell Ice Co., of Windsor. The building will be erected on Albert street and will be of brick and steel. It will cost about $20,000. The new plant will be in operation by May, according to Fritz Bridges, manager for the Bell Ice Company.

**St. Stephen, N.B.**—The big plant of the Canadian Sardine Co. at Chamcook, which has been in the hands of the Bank of Nova Scotia for several months, and which was erected at a cost of nearly a million dollars, has been purchased from the bank by Laing, Libby & Co., of Boston, at private sale. The new firm will erect a cold storage plant in connection with the present big outfit and will carry on the fish business in all its branches.

**Montreal, Que.**—A re-organization of the Ice Manufacturing Co., Ltd., has been effected, whereby the concern passes under the control of a new and strong directorate, the officers and personnel of which are as follows: L. J Smith, president; F. W. Molson, vice-president; B. Tooke, J. A. Cameron, Jas. Baillie, J. J. Robson and H. R. Drackett. Arrangements are being made to place the company in a stronger financial position, and, in addition, the company has entered into an arrangement with the Montreal Arena Co. to manufacture and supply ice for Westmount and Notre Dame de Grace, as its own output has already been contracted for.

## Marine

**Toronto, Ont.**—Hoping to get an early start this spring, steamboat owners have begun outfitting their steamers.

**Oshawa, Ont.**—In the Dominion Government estimates, $50,000 has been appropriated for harbor improvements here.

**Sarnia, Ont**—The G. T. R. has begun to dismantle the Northern Navigation wharf here and will erect a new structure about 800 feet long.

**Halifax, N.S.**—The Halifax Marine Engineering Co. has secured the contract for renewals and repairs to machinery piping and supply of boilers for the Canadian Government steamer Tyrian, at $16,750 and $9,200.

**Victoria, B.C.**—The Federal estimates for the current year contain large appropriations for both Victoria harbor improvements and the Esquimalt drydock. In the first instance, the sum is $1,400,000, and in respect to the drydock, the sum named is $250,000.

**Navigation Season Opening.**—It was announced on March 4, that the White Star Line running between Sarnia and Detroit would start its river service April 1. The Wauketa will be the first boat. The tug Fischer is the first steamer to open navigation at Sarnia, she having taken some machinery from there to Port Huron.

**Collingwood, Ont.**—The St. Lawrence & Chicago Steam Navigation Co. announces the following appointments of captains and engineers to its steamers: J. H. G. Hagarty—Capt. Samuel Hill, Chas. Robertson; E. B. Osler—Capt. C. E. Robinson, Wallace Robertson; W. D. Matthews — Capt. Wm. Cunningham, William Harwood; G. R. Crowe—Capt. J. H. Hudson, William Reid; Iroquois—Capt. D. A. Kennedy, Jas. E. Readman.

**Fort William, Ont.**—It is stated that the contract for the construction of two thousand feet of breakwater on the Mission river, Fort William, has been awarded to the Thunder Bay Contracting Co., and that work will be commenced on the new breakwater as soon as navigation opens. The cost of this work will be possibly in the neighborhood of a quarter of a million dollars, which forms part of the $1,200,000 in the Parliamentary estimates, for harbor improvements at the head of the lakes this year.

**Algoma Central Steamship Co.** — The Algoma Central Steamship Co. have made the following appointments of captains and engineers to their steamers for the ensuing year: Str. W. C. Franz—Captain W. C. Jordan, George Sylvester; Str. J. F. Taylor—Captain R. H. Boyle, L. R. Cronk; Str. Agawa—Captain J. A. Brown, J. L. Smith; Str. J. T. Drummond—Captain A. McIntyre, W. T. Rennie; Str. J. A. McKee—Captain H. C. Wingrove, John Knight; Str. Paliki — Captain R. J. Bassett, A. M. McInnes; Str. E. G. Carter—Captain C. H. Wilson, R. J. Sullivan.

**Prince Rupert Drydock.**—According to information given by G. T. P. officials, the new drydock at Prince Rupert will be completed in May, and ships will be locking there regularly next summer. G. T. P. vessels have, to the present, been going into drydock at Esquimalt. The new dock is designed to take vessels up to 25,000 tons, and will be the biggest on the coast with the possible exception of the one at San Francisco. It is being constructed with a view to trans-Pacific trade, and it will handle with ease two vessels the size of the Prince George or the Prince Rupert end to end.

## New Incorporations

**Lever Brothers, Ltd.**, Toronto, have been authorized to increase their capital from $3,000,000 to $4,000,000.

**Curtiss Aeroplane & Motors, Ltd.**, has been incorporated at Ottawa, Ont., with a capital of $50,000, to manufacture aeroplanes, sea-planes, etc., at Toronto, Ont. Incorporators—J. S. Lovell, W. Bain and R. Gowans, all of Toronto, Ont.

**Aube's Automatic Smoke Consumer Co.** has been incorporated at Ottawa, Ont., with a capital of $50,000, to manufacture an automatic smoke consumer at Montreal, Que. Incorporators—O. Aube, A. Roy and E. Viau, all of Montreal, Que.

**The Dominion Fibre Co.**, has been incorporated at Toronto, Ont., with a capital of $40,000 to manufacture wool stock, curled hair and felts, etc., at the village of Doon, Ont. Incorporators: J. H. McNally, M. J. Huber of Regina, Sask., and Homer V. Huber, of Doon, Ont.

**The Alliance Lumber Co.**, has been incorporated at Toronto, Ont., with a capital of $40,000 to carry on the business of a planing mill and to manufacture wooden ware, etc., at Hamilton, Ont. Incorporators: R. J. Press, M. Cole and Daniel Cole, all of Hamilton, Ont.

**Wettlaufer Bros., Ltd.**, has been incorporated at Ottawa, Ont., with a capital of $300,000, to manufacture all kinds of machinery, automobile supplies and accessories at Toronto, Ont. Incorporators—C. L. Wettlaufer, J. L. Wettlaufer and E. L. Wettlaufer, all of Toronto, Ont.

*IF IT'S MACHINERY—WRITE "WILLIAMS"*

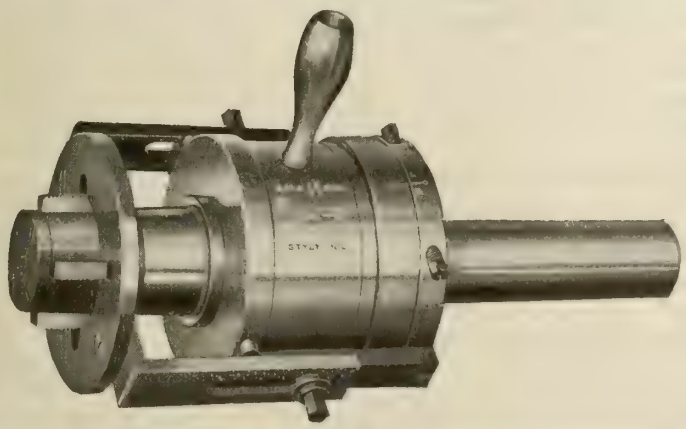
# WHAT DOES IT COST

To back a Solid Tap out of the work every time a thread is cut? Consider the damage to the threads and the number of broken taps.

DO YOU KNOW ABOUT THE

## Geometric Adjustable Collapsing Tap

that requires no backing off?



Geometric Collapsing Tap, Class "N-L." Equipped with Chasers for Plug Tapping.

Applied to your Drill Press or Turret Lathe, it will do better work, in half the time, than solid taps.

GEOMETRIC COLLAPSING TAPS are as rigid as solid taps while cutting, but collapse their chasers automatically when the required depth has been tapped.

Send for the Catalogue.

Incorporators, W. K. McKeown, H. Lacerte, and M. B. Flanagan, all of Montreal, Que.

**Canada Model & Machine Co.** has been incorporated at Ottawa, Ont., with a capital of $40,000, to carry on the business of manufacturers of all kinds of hardware specialties and machinery at Windsor, Ont. Incorporators W. J. Pulling, A .N. McLean and J. A. McLean, all of Windsor, Ont.

**Ottawa, Ont.**—The Ontario Niagara Connecting Bridge Co. is applying to Parliament for an Act of incorporation with power to construct and operate a railway and general traffic bridge over the Niagara River from some point within 6,000 feet south of the intersection of the northerly boundary of Welland County with the Niagara River.

## Catalogues

**Goggles.**—Eye protectors of various styles are described in a bulletin issued by T. A. Wilson & Co., Inc., Reading, Pa. Each style varies to suit particular requirements, and illustrations are given, accompanied by a brief description.

**Radial Drills.**—George Swift & Sons, Halifax, England, have sent us a circular No. 33, describing their universal radial drill and tapping machine. Brief particulars are given of several sizes which are also illustrated. Other types dealt with are a switchboard drilling machine and a motor driven double hinged radial. A list of machine tools ready for delivery is included.

**Uehling $CO_2$ Meters.**—Bulletin No. 103 issued by the Uehling Instrument Co., Passaic, N.J., illustrates and describes the standard styles of $CO_2$ and combined $CO_2$ meters, also temperature machines and the recorders and indicators used with them. Each type is illustrated and accompanied by a brief description covering the principal features and purposes for which it is best suited. In the concluding pages reference is made to the savings that can be effected by installing these appliances. A data sheet is also appended.

**Fabroil Gears** is the title of an attractive bulletin No. 48.702 recently issued by the Canadian General Electric Co., Toronto. The publication of this bulletin coincides with the fifth anniversary of the invention of Fabroil gears, formerly known as cloth pinions, and presents to the entire machinery trade a collection of illustrations showing the variety of applications for which these gears have been found well suited. The illustrations are excellent and show in a clear manner the gears or pinions operating under varying conditions.

**Motor Converters.**—Bruce, Peebles & Co., Edinburgh, Scotland, have sent us pamphlet No. 20 D, just off the press. In this publication a very full description is given of the Peebles motor converter accompanied by several excellent illustrations showing the machines and installations. Simple explanatory dia-

# FOR SALE

**Plant Suitable for Manufacture of War Munitions**

The Large Plant of the **Berg Machinery Manufacturing Company, Limited,** situate near the centre of Toronto's water front, and covering about two acres, with suitable buildings and railway siding thereon. The Plant consists of **Machine, Boiler, Foundry, Blacksmith** and **Pattern** Shops, and is adapted for the manufacture of war munitions.

For particulars apply to

**J. P. Langley & Co.,**
Assignees,
McKinnon Building,
Toronto.

# METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers.

**120 Adelaide St. W., Toronto**

grams are also to be found, together with characteristic curves, both for lighting and traction sets. On page No. 19 a most interesting comparison is given of motor converters with rotaries and motor generators, while on the last page there is a list of some of the more important motor converter users.

**Boiler Feed Regulators.**—The Northern Equipment Co., Erie, Pa., have issued a catalogue dealing with the Copes boiler feed regulators and pump governors. In part 1, the principal features of the Copes submerged tube regulator, also its construction and method of installation are fully described. Following are particulars of a number of tests accompanied by charts showing comprehensively the performance of the submerged tube regulator during the tests. The Copes feed valve is also described and tables are included giving the principal dimensions of each size. Part 2 describes fully the Copes regulator for ¼ in. regulation for conditions when it is desired to feed exactly in proportion to evaporation. The catalogue is fully illustrated and contains views of the apparatus installed in several boiler plants, etc. Copies of the catalogue may be obtained from H. L. Peiler & Co., Montreal and Toronto.

## MORE RAIL ORDERS FOR ALGOMA STEEL CORPORATION.

COMPETITION by the Algoma Steel Corporation, of Sault Ste. Marie, Ont., for rail tonnage in the United States against the makers in that country, has assumed more important proportions, with the placing with the Canadian concern of an order for 20,000 tons by the Illinois Central Railroad. This is the largest order yet taken by the Ontario mill, and it brings the aggregate of such sales to probably 40,000 to 50,000 tons, which have been entered at $2 to $3 a ton be-

low the prices of American mills. The Algoma Co., in addition, has taken 500 tons for the Toledo Terminal Railway Co. and 500 tons for the Northern Ohio Traction Co. As previously reported, it also has received 4,000 tons for the Hocking Valley, 5,500 tons for the United States section of the Pere Marquette, about 1,500 tons for one of the New York Central lines and probably other lots.

### ONTARIO WORKMEN'S COMPENSATION RATES.

FROM the experience of the Workmen's Compensation Board for the two months that the Act has been in operation it appears that the amount of the assessment levied on the different groups of industries was higher than will be required to meet the claims likely to be made. While this was the view of the Board, there was some doubt as to the wisdom of making the assessments lower, but it looks now as though the rate would be lowered at the end of the present year.

Since January first, 1,888 accidents have been reported to the Board, and 685 have been laid aside because the injuries sustained did not last longer than seven days. These figures apply to schedule 1, which includes industries grouped together. Under schedule 2, which is railways, corporations and municipalities, some 416 claims have been received. The Act appears to be working smoothly.

### DOMINION REVENUE INCREASE.

FOR the month of February the Dominion revenue shows an increase of $825,224 as compared with February of last year. This is the first increase in revenue reported for a year or so. The increase is in the main made up of $148,864 in customs revenue, $381,520 from excise, and $146,858 from railway receipts. The increased customs and excise receipts reflect the result both of the increased tariff and excise duties and of the rush of importers and manufacturers to forestall the expected increased taxes announced in the Finance Minister's Budget speech in the middle of the month.

Expenditure for the month shows a considerable drop, as compared with February of last year. Current expenditure decreased by $1,488,431, and capital expenditure by $555,732.

The net public debt increased during February by $6,513,392, and is now for the first time over the four hundred million mark. At the end of the month it was $401,891,909, as compared with $317,169,801 at the end of February last year, an increase of $84,222,108 during the twelve months. Temporary loans made by the Government now total $53,666,666, as compared with $18,006,666 on February 28, 1914.

BUFFALO, N.Y., U.S.A.

# Put Your Filing on a Scientific Basis

**The cost of Files is relatively small. The cost of Filing-Time is large. Hand-labor is always expensive.**

By a slight increase in the cost of Files, you can effect a substantial decrease in the cost of Filing-Time.

When a file requires more time and effort to perform a given piece of work, it has reached the "inefficient" point. From that time on, its further use means impairment of QUANTITY or QUALITY of work—or even both. The total loss through its use will be many times the slight extra cost of SEVERAL new files.

Insist that your men PROMPTLY replace all worn files, when they have reached the "inefficient" point. This point varies with the workman and the character of the work. It can be easily ascertained in your shop.

**KEARNEY & FOOT**
**GREAT WESTERN**
**AMERICAN**
**ARCADE**
**GLOBE**

***(Made-in-Canada)***

**In the interest of efficiency, promptly replace all worn files. For economy's sake, replace them with the "Famous Five."**

50 years' experience makes them EFFICIENT. A 60,000,000 output yearly makes them ECONOMICAL. Our specially designed and developed machinery makes them ACCURATE. Our complete control of every manufacturing operation makes them UNIFORM. Over 4,000 different patterns make them AVAILABLE for every class of work. Rigid inspections and real service-tests make every file a PERFECT tool.

**We suggest a trial of the Famous Five in YOUR shops. We rest our case on their SERVICE.**

## NICHOLSON FILE COMPANY, Port Hope, Ontario

# Points You Should Consider For Reducing Chucking Costs

Consider some of these reasons why B. & S. Plain Screw Machines have proved so economical on finishing castings, forgings and pieces cut from the bar. They are worth your attention.

**Head Cast Solid with Bed,** means steadiness under the heavy jobs. 3 point mounting preserves alignments.

**Ample Driving Power** by extra wide belt and powerful friction back gears. 4 speeds available without shifting belt.

**Convenient Operating Levers,** easily understood and quickly operated. No wasted motions because they are in the handiest places.

**Rugged Turret Slide Construction.** Broad bearings for turret and slide with means for easy adjustment. Positive abutment resists end thrust.

**Automatic Turret Clamping,** in addition to positive locking by vertical taper bolt under working tool.

**Powerful Turret Slide Feed** driven by chain and worm gearing. 8 changes for every speed, made without stopping spindle.

**Quickly Adjusted Cross Slide** makes setting up easy. Screw adjustment for tools and stops. Graduated dials provide for accurate forming.

**B. & S. Workmanship**—scraping to full bearings, finest allowances on finish and accurate alignments, resulting in machines of long life.

**Ask us to estimate production on your work.**

## The Mastery of Cleveland Twist Drills

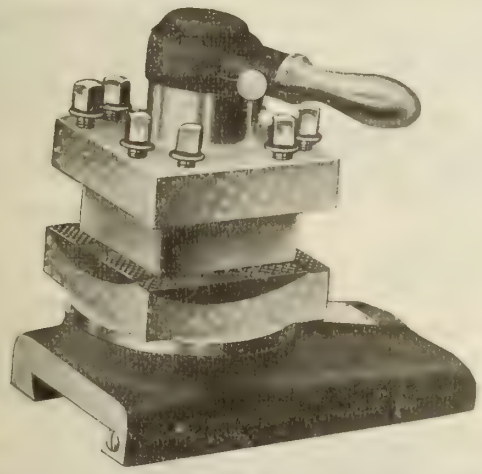
is best expressed in the fact that they produce more holes per drill than any other drill made.

Conspicuous in hole production—they make holes quickly, in large numbers, with minimum grinding.

**Read about hole makers in "Drill Chips."**

**If you are not getting it each month, may we send it?**

**The Cleveland Twist Drill Co.**
New York Cleveland Chicago



## Particularly Adapted to the Manufacture of Shrapnel

**Four-Sided Tool Posts Transform Any Engine Lathe**

One of our patented Quick Change Tool Posts, with its exclusive revolving features, will earn far greater dividends on your investment than a quick change gear.

We fit them to any make or size of lathe, old or new, and thereby transform it to a modern multiple production machine.

*A big convenience for a small price. Send for our new Booklet and full particulars.*

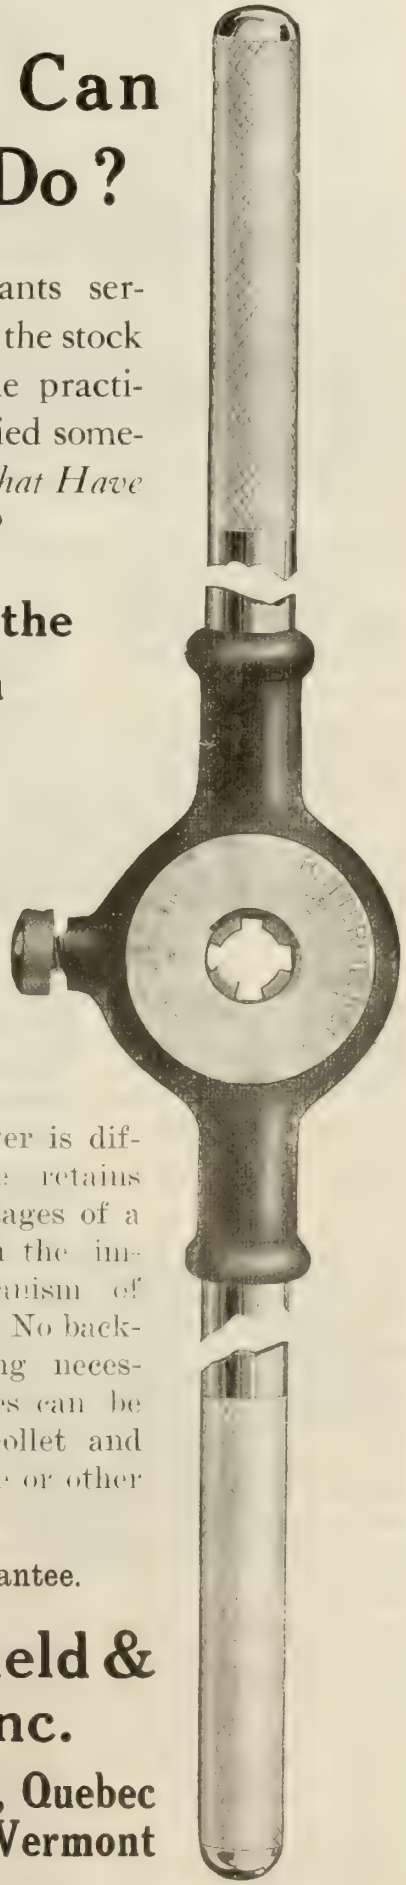
**Fay & Scott, Dexter, Me.**

## What Can You Do?

when he wants service? This is the stock phrase of the practical man, varied sometimes by *"What Have You Done"?*

**It's much the same with**

## Reece Screw Plates



only the answer is different. Reece retains all the advantages of a solid Die with the improved mechanism of adjustability. No backing and filling necessary. The dies can be reversed in collet and used in a lathe or other machine.

## CLEVELAND HOSE SPECIALTIES

### Bowes Automatic Air Hose Couplings

**Over 1,000,000 in general use**

**STYLE O.F.** is an Outside Thread Female Pipe End. Made in sizes ⅜-in. to 1½-in.

**STYLE I.F.** is an Inside Thread Female Pipe End. Made in sizes ¼-in. to 1½-in.

**STYLE H.F.** is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.

**STYLE H.M.** is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.

**STYLE O.M.** is an Outside Thread Male Pipe End. Made in sizes ⅜-in. to 1½-in.

**STYLE I.M.** is an Inside Thread Male Pipe End. Made in sizes ¼-in. to 1½-in.

The Male and Female Ends of Bowes Couplings interchange in sizes, ¼-in. to ¾-in. Sizes 1-in. and 1¼-in. interchange. The 1½-in. ends interchange only with themselves.

### BOWES COUPLINGS

Are instantly connected or disconnected.

They are absolutely air-tight under all pressures.

They quickly pay for themselves by stopping costly leaks.

They interchange in sizes most commonly used.

They have no loose parts to be mislaid or lost.

They are made of brass and will not rust.

The U-shaped interchanges in couplings ¼-in. to ¾-in.

### The Cleveland Never Slip Hose Clamp

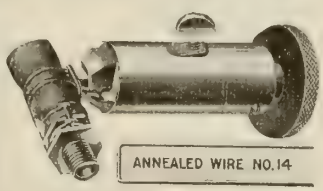
**Made in same sizes as Bowes Couplings**

The adjoining cut of Never Slip Hose Clamp shows the "Flanges" which engages the groove provided in all hose ends of Bowes Couplings. The "Model Hose Line" illustrated shows correct styles of couplings to use and proper way to attach the clamps.

### CLEVELAND GROOVED HOSE NIPPLE

Grooved Nipples when attached to hose with the wire clamp cannot "blow out," as one-half of the Wire Clamp lies in Nipple Groove, and the other half on the hose, uniting nipple and hose permanently. "Blow outs" are expensive, as one to five men are idle while new connection is being made; time wasted, ten to thirty minutes. Can you afford it?

### WIRE CLAMP TOOL



To apply Wire Clamps to Grooved Hose Nipples you need the Wire Clamp Tool illustrated, a small hand-operated tool at moderate cost which we carry in stock for immediate delivery.

In Stock: Riveting and Chipping Hammers, Four-piston Air Drills, Corner Drills, Emery Grinders, Sand Rammers, Holder Ons, Etc.

**WRITE FOR BULLETIN NO. 29.**

**IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in sma ll leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and stop costly leaks.**

**Write for Catalog No. 12, which illustrates our complete line of Air Tools**

Blau-Gas

# OXY-BLAUGAS

FOR

WELDING, CUTTING

AND

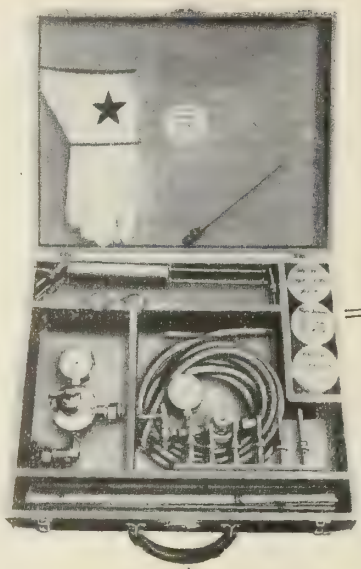
BRAZING

For Information Address

Canadian Blaugas Co., Limited

Dept. A. 304 E. T. Bank Bldg.

MONTREAL, P.Q.



# No. 2 Portable Welding Equipment

**High in Quality and Efficiency but low in price**

This outfit is designed for garages, factories, sheet metal works, boiler shops, job shops. With it cast iron, steel, copper, brass, aluminum, bronze and malleable iron are readily and successfully welded. This complete welding plant includes our regular combined welding and cutting torch, also carbon removing attachment.

WE WANT THE OPPORTUNITY OF PROVING ITS IMPORTANCE TO MODERN SHOP PRACTICE. **Your communication with us will be a few minutes of your time extraordinarily invested.**

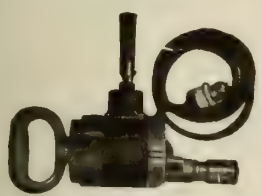
**Includes our regular combination welding and cutting torch**

## THE METALS WELDING CO.

CLEVELAND, OHIO

# U. S. Electric Drills and Grinders

**Save Time, Labor and Money**



They can be attached to any lamp socket.

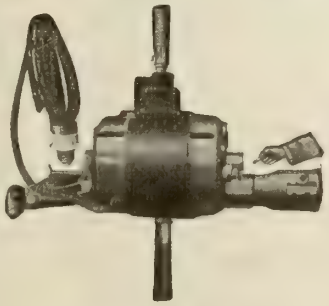
For drilling in metal they are superior to any other kind of portable drill. Cost 50% less to run than air drills.

**3 SIZES.**

**3-16 inch, W.G.T., 6 lbs.**
**¼ inch, W.G.T. 9 lbs.**
**⅜ inch, W.G.T. 12 lbs.**

All motors wound for 110 or 220 volts. Direct or alternating current.

Try a few of our Electric Drills and Grinders and you'll send us an order for more. Our guarantee protects you.



**½ inch—2 SPEED.**

**Speed, 400-750 R.P.M.**

**For Sale By**

**The Canadian Fairbanks-Morse Co., Limited**

**Montreal, St. John, N.B., Toronto, Winnipeg, Calgary, Vancouver.**

## THE UNITED STATES ELECTRICAL TOOL CO.

CINCINNATI, OHIO

## 16 in. Lever

# POST DRILL

**A Giant Little Machine For Light Drilling.**

**Will drill up to ⅞ inch.**

The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16-inch circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½-inch shank twist drills.

Speed of countershaft for average work, 300 per minute.

WHEN you need new equipment or supplies for your machine shop

**Consult this Directory**

¶ You'll find listed here the reliable makers of the lines you need; firms who believe in the progressiveness of present-day manufacturers and who appeal to their intelligence through their own engineering journal.

¶ Consult Canadian Machinery Buyers' Directory and you can't go wrong in your buying.

**Trucks, Lumber and Kiln.**

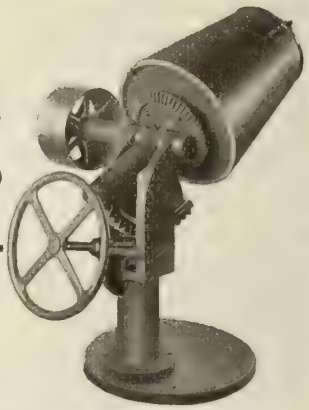
**Wrenches, Pipe, Monkey.**
Bemis & Call Hardware & Tool Co. Springfield, Mass.
Trimont Mfg. Co., Roxbury, Mass.

**Wrenches, Ratchet and Basin.**
Bemis & Call Hardware & Tool Co. Springfield, Mass.

## Make One Barrel Do What Two Barrels Did Before



THE minute you install one Globe Tumbling Barrel you can pension two of your old-fashioned horizontal barrels and still do a wider variety of work —and do it a great deal better and many times faster.

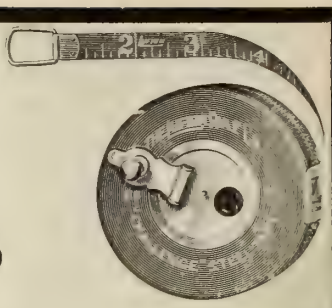
**GLOBE TUMBLING BARRELS**

save time because they don't have to be stopped for filling, emptying or inspecting of the work. They save floor space, because they stand vertically and occupy little room—and they save money, because they require a smaller investment in barrels.

**Eight stock sizes, $50 to $170. Our Booklet 2 contains useful information on tumbling — shows the different styles of Globe Barrels and tells what each will do. Write for a free copy to-day.**

**The Globe Machine & Stamping Co.**
**Cleveland, Ohio, U. S. A.**

## LUFKIN TAPES AND RULES



**NOTED FOR ACCURACY**

We make a complete line of

MACHINISTS' SCALES — MEASURING TAPES
FOLDING STEEL RULES — WOOD RULES
FOLDING BOXWOOD RULES
SPRING JOINT RULES

Our goods are stocked by prominent hardware and supply houses throughout the Dominion. They are fully guaranteed.

**Catalogue on request.**

No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.
Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.
*How to use Stevens' Stopper, or Circle Cement:*
Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings, and that means the saving of your dollars.
Another thing—I do not ask a fancy price for it.
A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

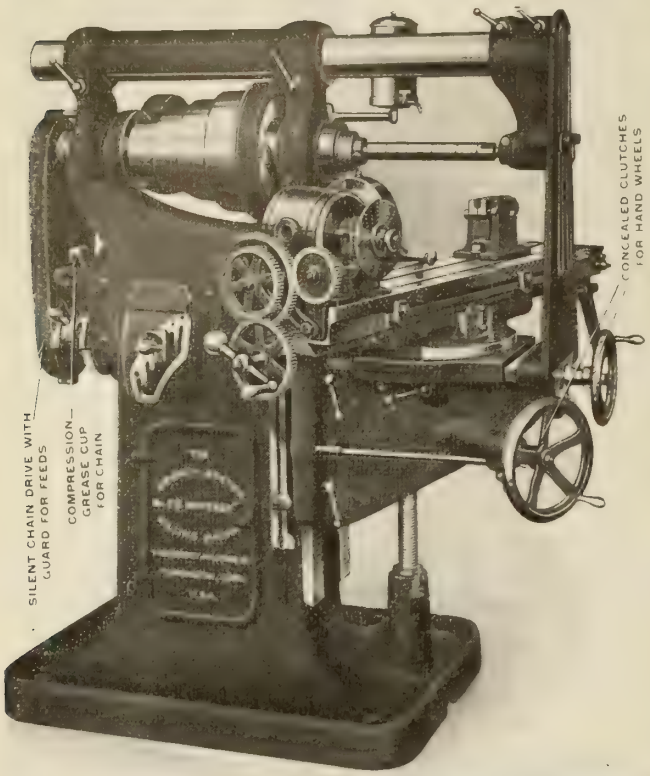
# No. 2B UNIVERSAL MILLING MACHINE



## Sets a new high-mark for efficiency and economy

Main Spindle has taper journals which run in annular bearings.

Constant lubrication is assured by ring oilers which revolve with spindle and pump oil from reservoirs underneath bearings.

Thrust is taken on front bearing, and journals have independent adjustment in either bearing.

Feed Shaft is driven from spindle by heavy silent chain protected with complete guard, supplied with compression grease cup for lubricating chain and sprockets.

All Feeds positive driven through gearing, giving 18 changes.

Automatic Feeds can be operated simultaneously and reversed while machine is in motion.

Feed Gearing is Hardened and feeds have independent controls.

Vertical and Cross Feed Hand Wheels have concealed clutches in hubs which allow wheels to run free on shaft when not employed.

Dividing Head is cylindrical in pattern. Supporting Block for Spindle is carried by side plates which recess into block and have annular bearings in ring of main frame.

# This Micrometer Saved Over 40 hours of his time

On a job of turning 5,000 pieces, each having five different diameters, this micrometer was substituted for the several ordinary micrometers previously used by this mechanic on this kind of work. The saving in calipering with the

# Starrett
## Quick Adjusting Micrometer

was easily three seconds for each diameter, and each diameter was calipered twice, making a saving of 3x5x2x5000=150,000 seconds or more than forty hours. This is far more than the cost of the tool saved in that one job. Can you afford not to be familiar with Starrett tools?

BY INVITATION MEMBER OF

The secret of the quick-action is the plunger in the end of the spindle which, when pressed, permits the micrometer to slide to its adjustment.

**Starrett tools may be seen at any good hardware store or send for our big, new, free catalog No. 203 and learn what tools your work requires.**

**Starrett Tools and Hack Saws are sold at all good hardware stores.** 42-281

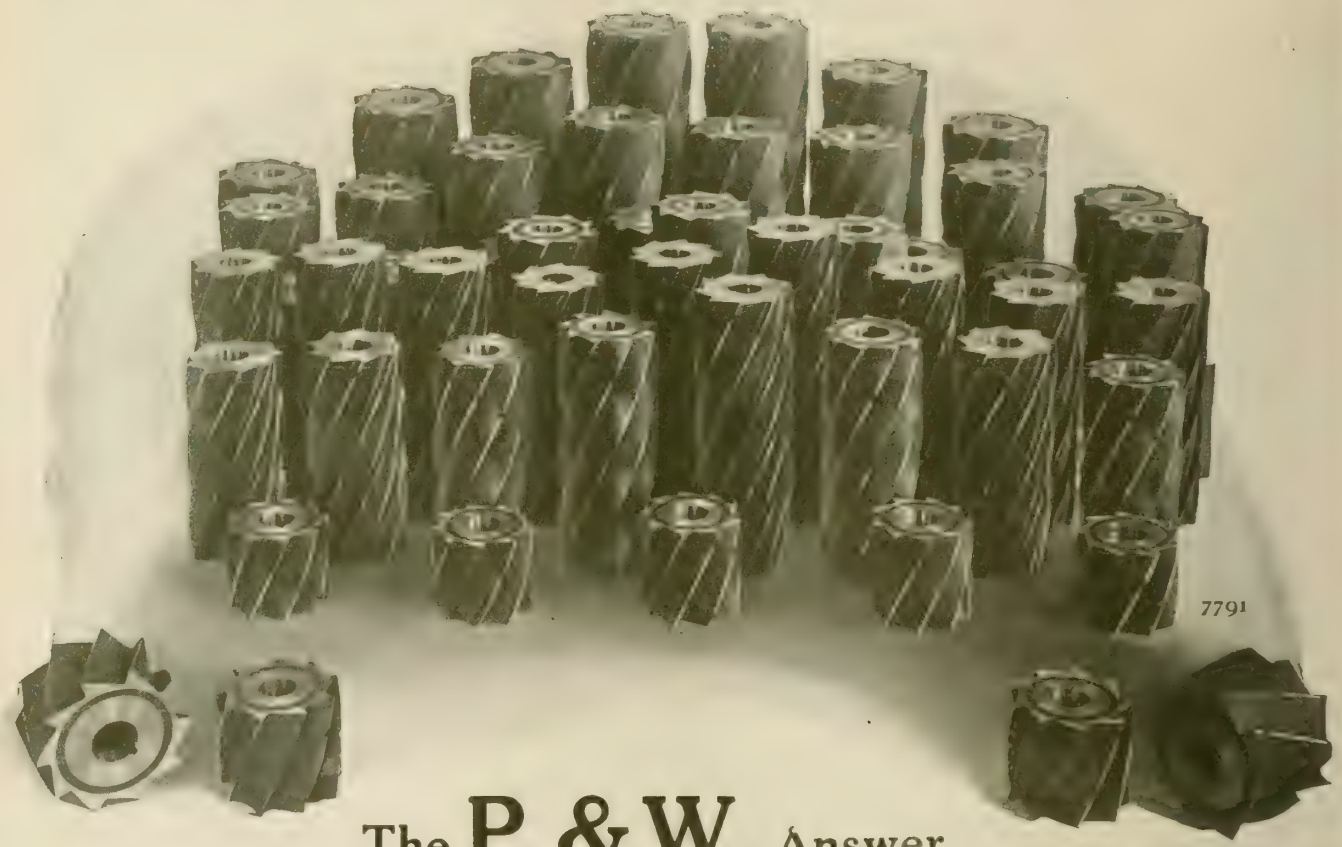
# Your Heavy Duty Cutter Problem



## The P.&W. Answer

### Use Coarse Tooth, High-Speed Milling Cutters

We are prepared to furnish promptly coarse tooth milling cutters of High-Speed Steel adapted primarily to the heavier class of milling.

**Long Life**

Such cutters have the advantage of long life as the large teeth permit of more grindings. It will also be seen that less time is required to sharpen.

**Increased Production**

The ample chip room insures a remarkably free cutting action and will increase production by a high percentage with less power required to drive.

**Strong Teeth**

The teeth being larger are exceptionally strong and will easily stand the heaviest feeds without breaking.

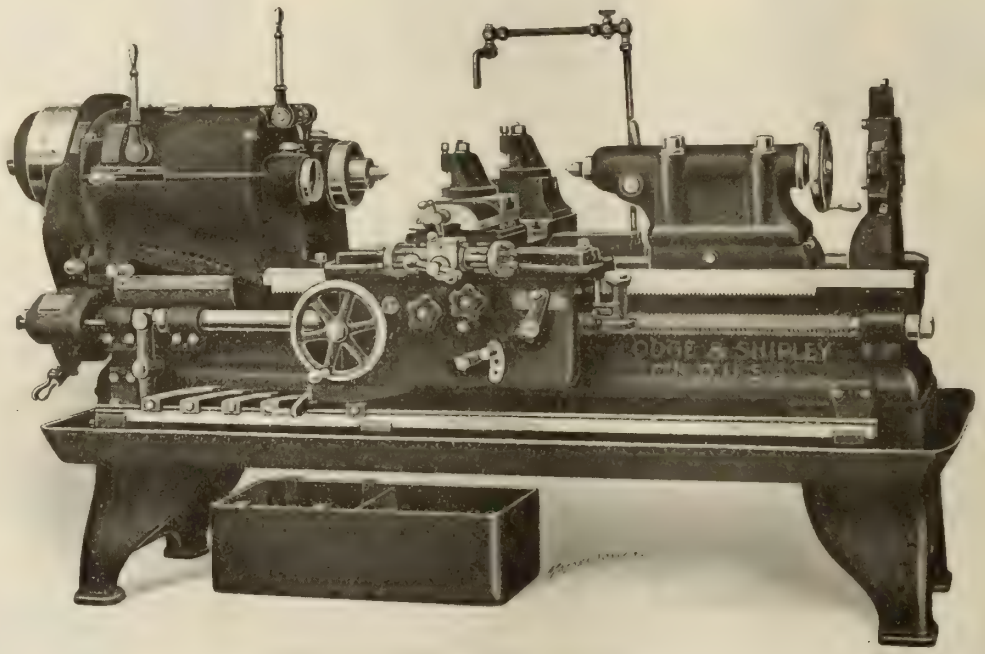
# FOR SHRAPNEL



18" "Selective Head" Lathe with Manufacturing Equipment.

For turning shrapnel cases, and for the final finishing operation on the assembled shell, we are furnishing quantities of 14", 16" and 18" lathes. These we offer with "Selective Head" as above illustrated, and with Cone Head.

The "Selective Head" is a powerful single pulley, all-geared head, with twelve mechanical speed changes incorporated in the headstock proper.

Manufacturing equipment, consisting of multiple stops for length and cross feeds, connected compound and plain rests, pan, pump and tubing, is especially advantageous for rapid and accurate duplication.

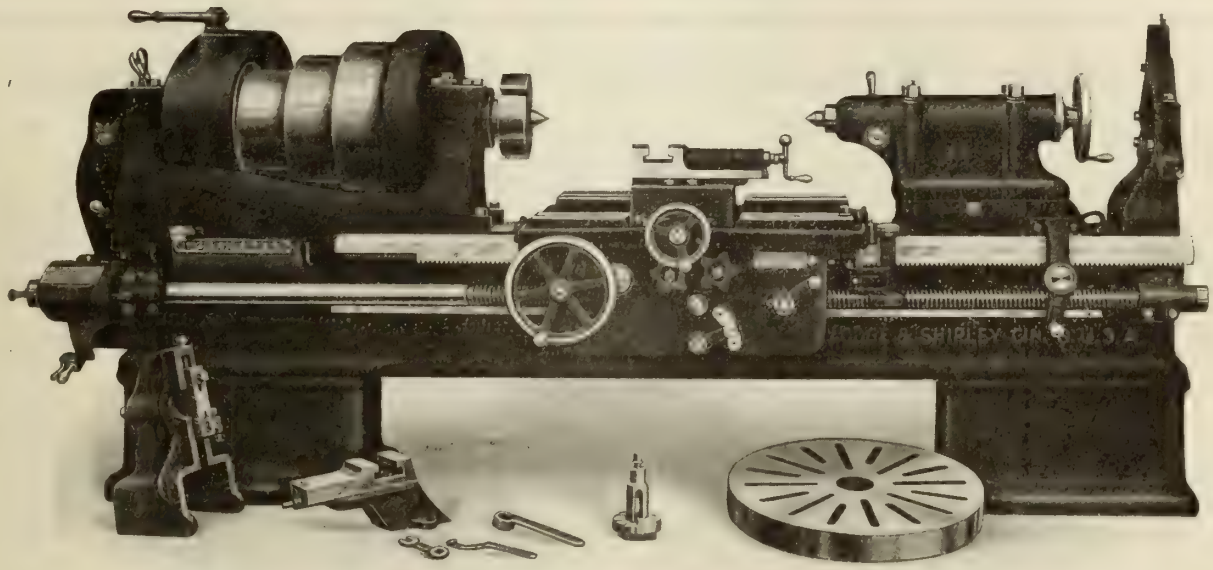
*Lathes—Good Lathes Only, 14" to 48" swing.*

## The Lodge & Shipley Machine Tool Co.

**Cincinnati, Ohio**

*The advertiser would like to know where you saw his advertisement—tell him.*

# FOR LYDDITE



24" Three-step Cone Head Engine Lathe.

Lyddite and other high explosive shells, which are commonly made in larger caliber than shrapnel, require correspondingly heavier lathes for manufacture.

We are supplying lathes from 18" to 48" swing for manufacturing various sizes of the heavier shells, ranging from 4" Lyddite high explosive shells, for field guns, up to 15" Naval Projectiles. These lathes are supplied with "Selective Head" or Cone Head and with or without the manufacturing equipment, depending upon the class of work to be handled.

We are lathe specialists, and shall be glad to make expert recommendations and explain the particular advantage of the Lodge & Shipley Engine lathe for your work.

*Please let us know details of your requirements.*

# HILL, CLARKE & CO. OF CHICAGO
## 125 N. Canal Street, Chicago

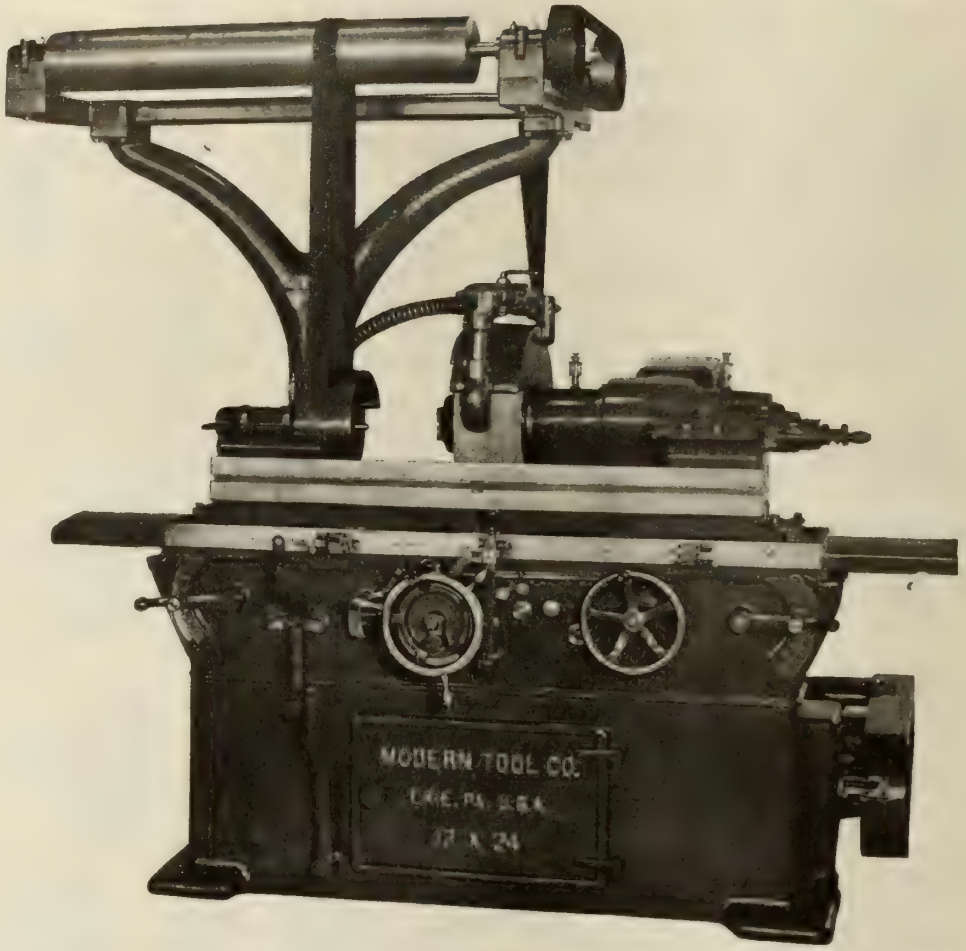
# Finishing Shrapnel Shells

ON THE

## "MODERN" 12" x 24" Self-Contained Grinding Machine



## The heaviest, most powerful and efficient Standard Grinding Machine made for Shell work

The "MODERN" 12" x 24" Grinding Machine is especially adapted for grinding Shrapnel Shells. The Machine is more than guaranteed, it is demonstrated. Large diameter, wide face wheel, with powerful drive—automatic feed without traversing the table—absolute central control of all levers and hand wheels—single constant speed drive.

We have recently sold a large number of these Machines in Canada, completely equipped for Shrapnel Work. Ask the man who is using the "MODERN."

The large manufacturer appreciates the production possible on this Machine. Machine comes equipped for all classes of straight and taper cylindrical work.

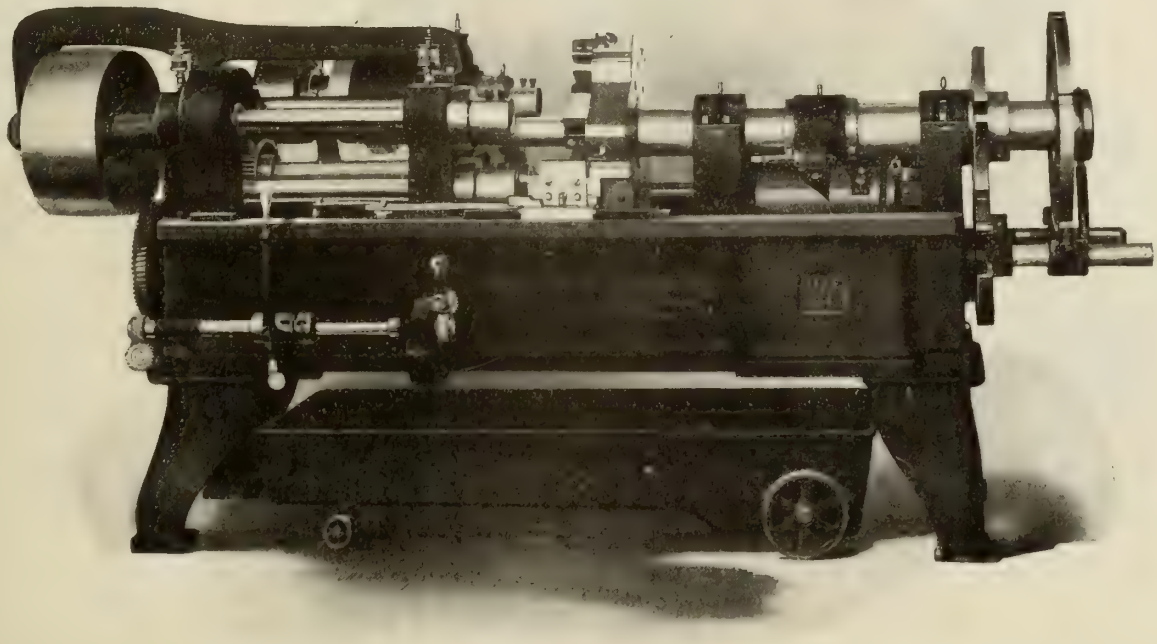
**Send for blue prints and estimates.**

# Modern Tool Company

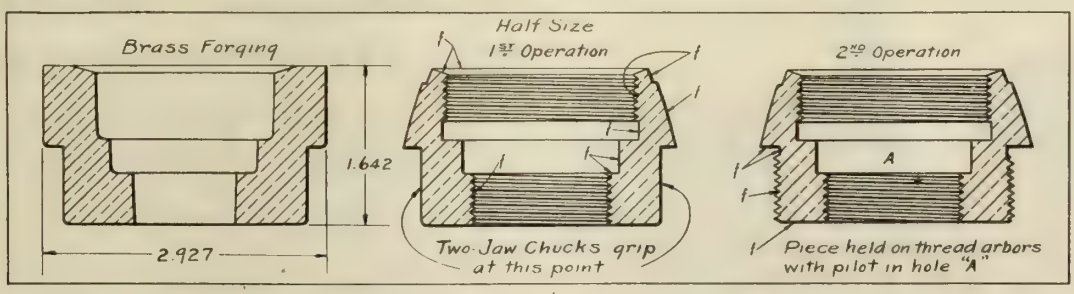
**Main Office and Works: State and Peach Streets, Erie, Penn'a.**

**Canadian Agents: Rudel-Belnap Machinery Co., Toronto and Montreal**

# Shrapnel Equipment? Here it is!



## The "NEW BRITAIN" Automatic Chucking Machine Will Finish Three to Five Times as Many Pieces Per Hour as is Possible by any other Method



The 18 Pdr. High-Explosive Shell Head shown above was fully machined in two settings on our Size 24 Single Head Machine. First setting: faced; formed outside; bored three diameters; recessed; and tapped two diameters. Second setting: faced; turned; necked and threaded.

Each setting was completed at the rate of 120 per hour, or 60 per hour for the finished piece. The two internal threads of **different pitch** were cut simultaneously with a combination tap head. The blank was a brass forging.

**If you are considering new equipment for this purpose, and want the most efficient, your selection is an easy matter. There is but one Automatic Multiple Spindle Chucking Machine made—the "New Britain." One American manufacturer alone has ordered 34 of these machines.**

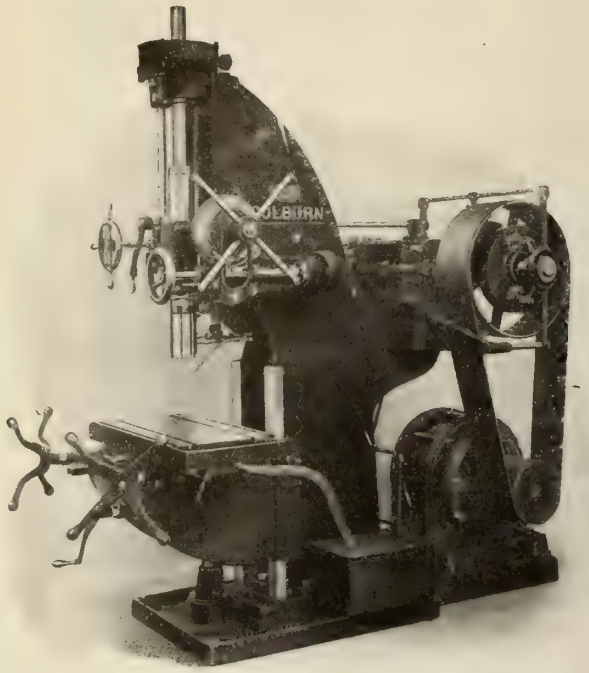
# Colburn Heavy Duty Drill Presses



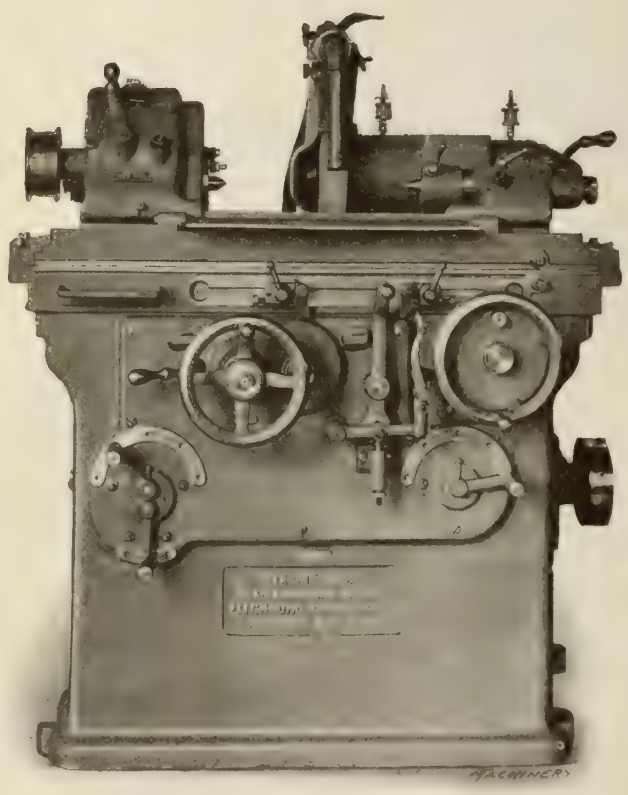
Drive high-speed drills to the extreme limit of their capacity.

Drilling can be done much more rapidly on a Colburn drill press than on any other type of machine, on account of the great power stiffness, rigidity, freedom from vibration and ease of operation.

Built in several sizes to meet differing needs.

Write for details — we can save you big money on your drilling work.

**COLBURN MACHINE TOOL CO.**
**FRANKLIN, PA.**



# SHRAPNEL GRINDING

## THE FITCHBURG 6x15 GRINDER

**MAXIMUM PRODUCTION**
**MINIMUM FLOOR SPACE**

Ease and economy in operation because of its CENTRALIZED CONTROL. Automatic sizing device; automatic cross-feed, independent of Table Traverse. Powerful work drive. Large wheel capacity. Made in two Models, Model "A" full automatic, Model "B" hand feed.

Write for full details.

**FITCHBURG GRINDER CO.**

# You can't make the most of the big demand for **SHRAPNEL** without a

# Lo-swing Lathe

Lo-Swing economy on Shrapnel work is tangible. We can prove its savings on your own work. We'll tell you exactly just what you can save in turning Shrapnel shells on this lathe.

March 4 we explained how all the outside turning and cutting on a shell could be accomplished with one setting of the cutting tools. We also showed how all the internal work on the shell could be accomplished by a single setting of the cutting tools.

The special chuck and expanding arbor which we designed for this work cuts production time wonderfully. We'd like to tell you the full story.

If you want to know exactly what savings you can effect on this class of work in your shop, send us your blue prints and we will give you *guaranteed turning time* on a

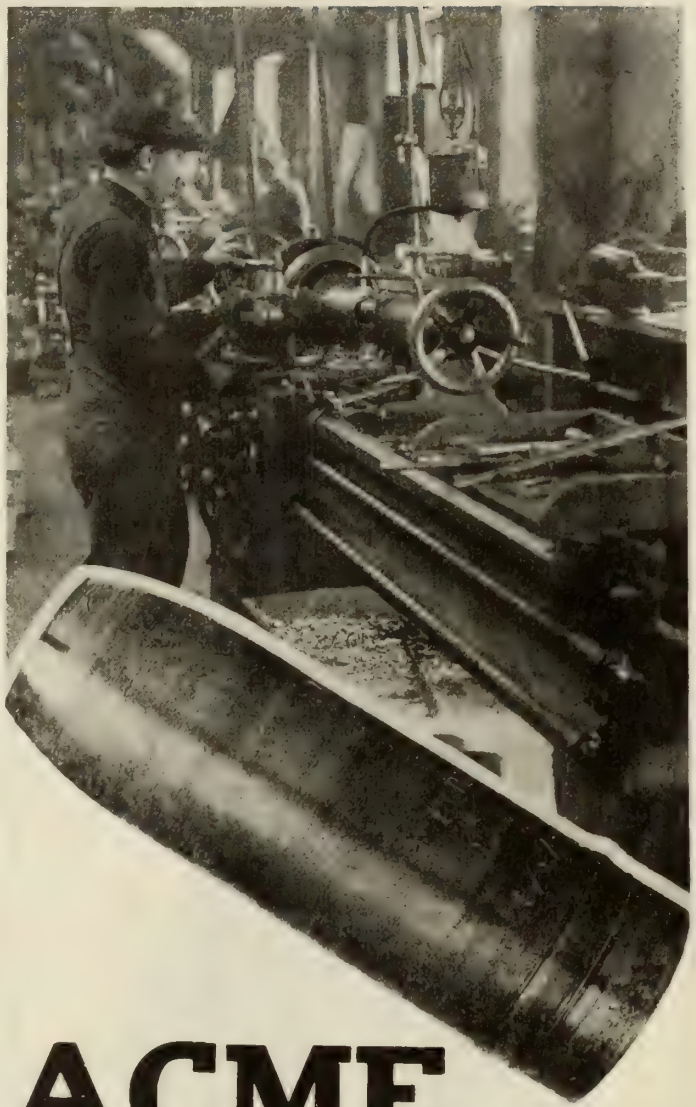
You can no longer afford to use the old style single tool holder.

Give us the size of the dovetail on your lathe carriage and height to lathe center; we will quote you price on a Modern Tool Holder that we guarantee will increase your production, and give you some interesting facts about Lathe Turrets.

No matter what make or size of lathe—we can fit it.

**Fay & Scott, Dexter, Me.**



# ACME

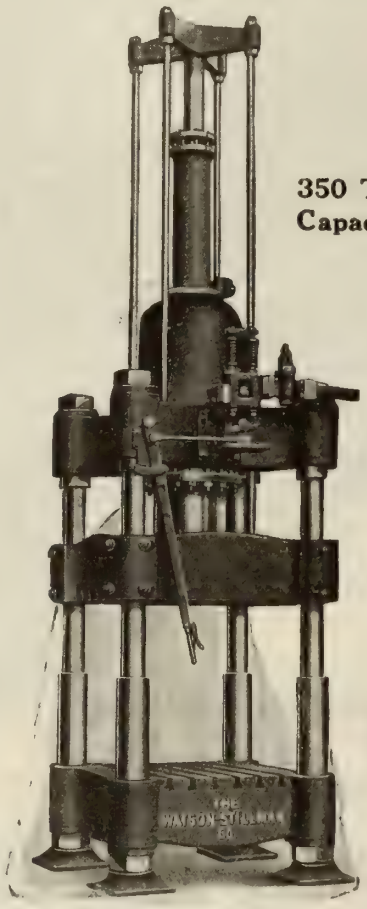
## Cutting Lubricant
### used on Shrapnel Shells

produces the desired results in tool lubrication at one-half the cost of oil; increases production and decreases tool cost; works equally as well on Turret Lathes, Milling Machines, Bolt Cutters, Nut Tappers and Drill Presses.

**We solicit your trial order and will ship subject to practical test and your approval.**

**Cataract Refining Co., Limited**
**Toronto, Ont,**

# Hydraulic Forging Presses



350 Ton Capacity

This is a first-class press for any forge shop or machinery builder. It may be used for die forging, forcing, forming, bending, straightening, flanging and many other miscellaneous shop jobs.

It is operated by a single lever balanced spindle valve which has the ram under instant control at any part of its stroke. The hydraulic pull back is opened to the main pressure line and no valves are required for its operation

It will pay you to consult us before placing your orders for equipments. Our large line of over 4,000 patterns offers many examples of labor-saving and efficiency-producing hydraulic machinery.

# Second-Hand Turret Lathes and Automatics

## FOR SALE

We have a number of machines no longer suited to our work which we offer for sale at exceedingly low prices. The ages of these machines are given in the list below. They have had good care. All these machines are in our own plant at Springfield, Vermont, and every facility will be given for examination on the part of intending purchasers.

| Machine | Maker | Installed |
|---|---|---|
| 19" Flat Turret Lathe, jig tool on turret, countershaft, 12" chuck with jaws | Jones & Lamson | 1896 |
| 19" Flat Turret Lathe, jig tool on turret, counter | " | 1898 |
| 19" Flat Turret Lathe, jig tool on turret, counter, face plate, 12" chuck, tools blocks | " | 1903 |
| 3 x 36 Flat Turret Lathe, 14" chuck with 1 set of jaws, no tools | " | 1896 |
| 2½ x 26 Combination Lathe, 12" chuck, jig tool on turret, motor drive, no motor | " | 1903 |
| Automatic Chucking & Turning Lathe, chuck with 1 set of jaws | Potter & Johnston | 1903 |
| Four 5½ x 10 Automatic Chucking Lathes, each with chuck and countershaft | " | 1907 |
| Gisholt Lathe H, motor drive, with motor, chuck with 3 sets of jaws, 4 boring bars | Gisholt | 1903 |
| Gisholt Lathe H, chuck with 3 sets of jaws, 2 boring bars, no counter | " | 1898 |
| Hartford Automatic Screw Machine, counter, No. 3 Hartness Die, Turning tool, cut-off, 2 tool holders | Hartford Machine Screw Co. | 1899 |
| 19" Flat Turret Lathe, jig tool on turret, two 2" turners, counter | J & L | 1896 |
| 20 x 16 Chucking Lathe, monitor turret, carriage for cutting off and forming, counter | " | 1892 |

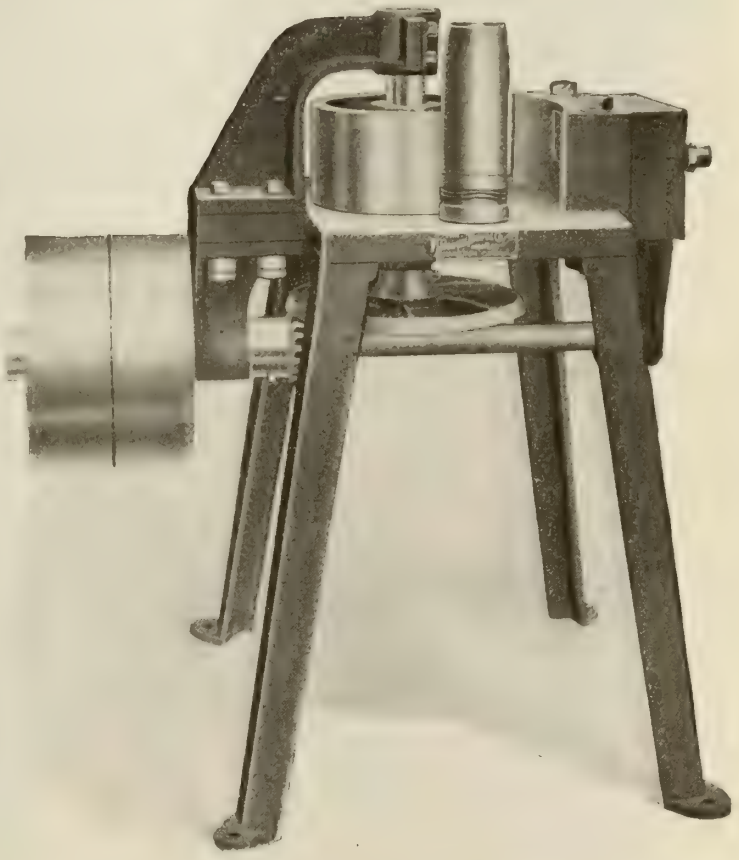
# IT'S EASY NOSING SHELLS

On a B.B. press. Our special 320A geared, straight-sided press for nosing 18 pr. shrapnel shells is a powerful, efficient and rapid equipment for shell work. *After the "shell game" is over,* the addition of a special bolster plate will enable you to utilize this press on a wide range of other work. Then why purchase a press that can qualify for shell work only? It's poor economy.

**You Will Want More Nosing Dies.**
**Let Us Figure on Your Next Set.**



## MARK SIXTY SHELLS A MINUTE

This is what we claim for our machine for marking shells on the body. The capacity is only limited to the speed the operator can feed the shells. There is only one REAL Marker, and *that's the B.B.*

If you are interested in a Press for nosing, or a machine for marking 18 Pr. Shrapnel Shells, your FIRST DUTY is to advise us. WE will furnish full particulars.

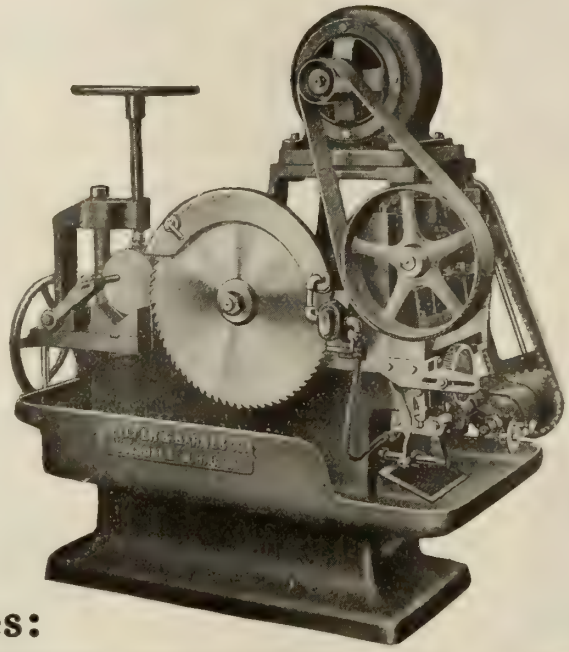
# High Speed Metal Cutting-Off Machines
## and Accessories

### 1915 Models

New 8″ High Power Automatic Metal Cutting-off Machine fitted for direct motor drive.

Note: The Motor is a unit of the machine; all compact and away from dirt and danger



Other Sizes, capacity from 4″ to 10″ squares, rounds or structural shapes.

The fastest, most accurate and most economical metal cutting machines made.

**Details in Catalog sent for the asking**

## Special Features:

Direct Spur Gear Drive gives unusual power and is very compact. A 22″ saw will cut through stock 8⅜″ in diameter. Forced Lubrication permits of high speed cutting. Taper Adjustments for keeping saw carriage in alignment. Saw Hood protects both operator and saw. Single Lever Control for starting and stopping the feed. Four Feed Changes from gear box. New Stock Feed Attachment, a time and labor saver in cutting long bars.

**OUR MACHINES ARE USED IN LARGE NUMBERS FOR THE MANUFACTURE OF SHRAPNEL SHELLS**

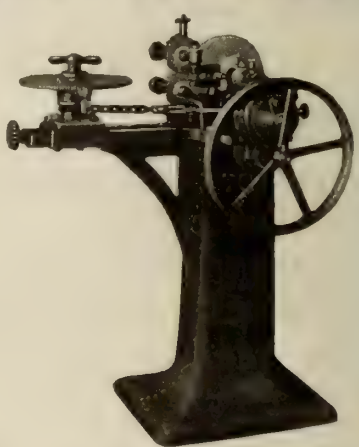
**Abrasive Wheel Metal Cutting-Off Machine**

An indispensable machine for any metal working shop, and especially well suited for tool room use. Cuts off pieces of metal as fast as a man can handle it. Recommended for cutting high speed tool steel up to ¾″ square or round. Handy, quick and clean cutting. A great time saver.

**Automatic Saw, Gear and Milling Cutter Sharpener**

For sharpening Cold Metal Saws, Milling Saws and Gear and Milling Cutters. Will soon pay for itself in renewing old saws and cutters that have been consigned to the scrap heap. Take saws 2½″ to 12″ diameter and Gear Cutters from 2½″ diameter up.

***Write for details to-day***



**Double Automatic Saw Sharpener with "B & S" Relief Attachment**

For sharpening and backing off all the teeth of a metal saw and double-relieving the alternate teeth, all at one setting. Saws sharpened with alternate relieved teeth give the same results as roughing and finishing tools. Best for soft, tough or stringy metal. Can be used as a plain sharpener when relief is not wanted.

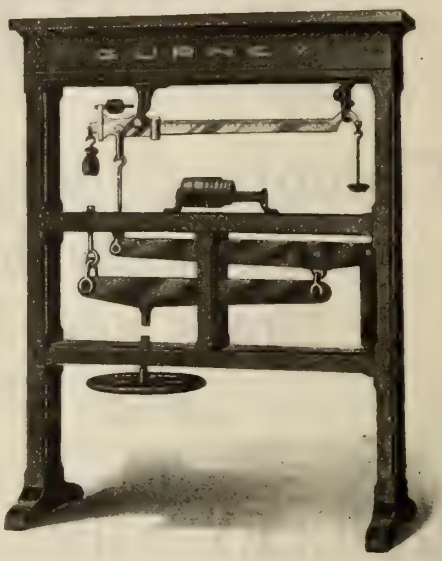
# TESTING MACHINE for SHRAPNEL SHELLS

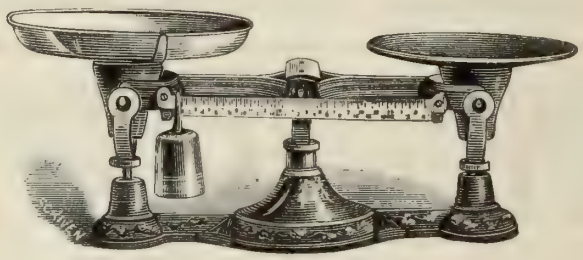
This machine is used in testing tensile strength of parts of shells in the course of manufacture. Specimens can be tested in a few minutes showing which is the best iron for the requirements.

By turning the hand-wheel below force is applied to the specimen, which can be weighed by the beam, the force to be continued until the specimen is broken.

The frame-work is substantially constructed of selected timber and the machine throughout is of the highest class of workmanship.



It can afterwards be converted, if desired, into a machine for testing inch bars of cast iron.



No. 1. Capacity 25 lbs. Agate bearings. Beam graduated one dram to 8 ozs.

# Shrapnel Shell Service and Constructional Features

Staff Article

*Arising out of this European war, not the least interesting feature, if only on account of its novelty, although its significance is much more diversified and potent because of the stimulus given to both our industries and to our Empire patriotism, was that of the decision to manufacture shells in Canada. Interesting data relative to shells generally are here given.*

IN view of the fact that shrapnel shell manufacture has developed to an extent hardly anticipated when the Annual Review Number of Canadian Machinery was published on December 31, 1914, and in response to numerous requests from interests only indirectly in touch with affairs mechanical, we have pleasure in reproducing in part the article which appeared in that issue entitled "The Manufacture of Shells, an Impromptu Canadian Industry."

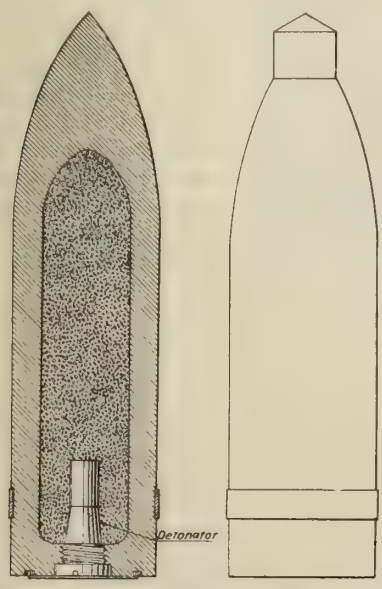

FIG. 1. SIMPLEST FORM OF EXPLOSIVE PROJECTILES.

Projectiles, commonly known as shells, have a number of different purposes and vary widely in construction. In Fig. 1 is shown a simple and much-used form of explosive projectile. The explosive charge is seen encased in the solid steel of the shell and is provided with a detonator at the rear end which is intended to explode the charge upon impact or immediately afterwards. The left half of the figure represents a projectile designed for the destruction of fortresses, earthworks, etc., where high explosive power is required. When required to pierce hardened steel armor, this shell is provided with a covering of softer metal over the hardened point. Otherwise the shell would simply shatter itself without perforating the hardened projective surface.

### Shrapnel Shells.

For the destruction of men and other animate objects, the type of projectile known as shrapnel is employed. Two typical shrapnel projectiles are shown in Fig. 2, and their operation is as follows: The nose or time-fuse can be adjusted to explode the shell at any predetermined time after its discharge from the gun, and an effort is made to have the shell explode about a hundred yards in front of the enemy and directly above him. The case is made of a high grade of steel and is not itself shattered.

The flame from the time-fuse explodes the powder in the central tube and the rear end of the shell. This simply blows the fuse-end off and discharges the whole load of bullets straight ahead as if shot from an enormous shotgun. The explosive charge is not large in comparison to the weight of metal discharged but, as the projectile as a whole has a very considerable initial velocity, each bullet will have sufficient energy to administer a disabling wound at 100 yards, and bullets enough are provided to furnish one for every square yard of surface attacked.

### Timing Arrangements

Shells are timed both by clockwork and by a time fuse. A typical example of the latter is shown in Fig. 3. Upon discharge from the gun the inertia of the percussion plunger P causes it to shear off the resistance ring R and fly back against the firing pin A which explodes the primer charge J. The flame from this passes

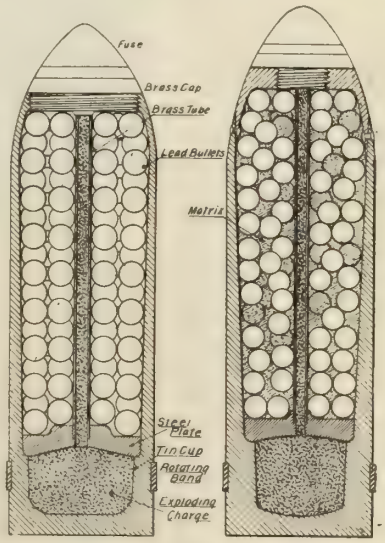

FIG. 2. TYPICAL FORMS OF COMMON SHRAPNEL.

through the hole B and ignites the fixed time-train C. This fixed time-train burns around until it comes to the hole E, through which the flame can pass to the

movable time-train at its lower end. The movable time-train burns back until the hole D is reached through which the flame obtains access to the powder G which forms part of the bursting charge of the shell.

It is easily seen that, by rotating the movable ring M so that the holes E and D become further separated around the circumference of the shell, the time required for the train C to burn around to the hole E and back along the movable train to the hole D is increased. The time allowed, of course, depends upon the distance the shell has to travel from the gun to the point where it is desired to discharge the bullets, and if the holes E and D be placed directly in line, the shell will explode but a few feet from the muzzle of the gun.

The time-train rings do not form complete circles so that for transportation, or if it be not desired to use the time fuse, the hole E is set opposite the blank part of the time train C. In case the shell fails to explode through the agency of the time-fuse, it will explode upon impact. Upon firing, the percussion ring H slips back over the plunger which carries the firing-pin K. Upon impact of the shell with some solid object, the whole flies forward, the pin K exploding the primer charge T. This instantly ignites the exploding charge G through the tube O.

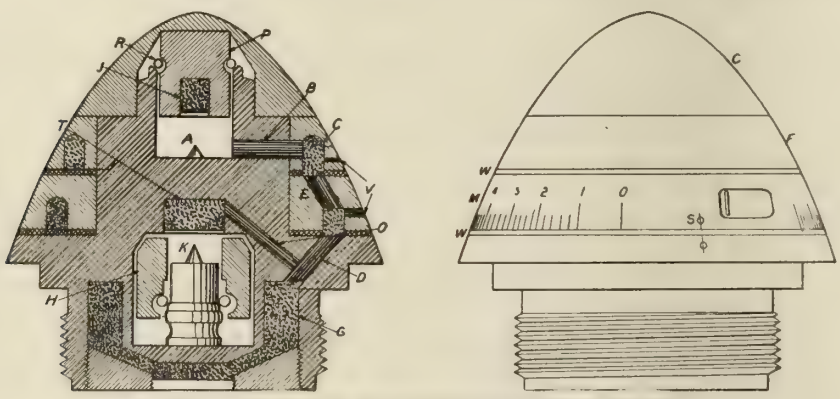

FIG. 3. DETAILS OF ADJUSTABLE TIME FUSE.

### The Explosive.

The explosive used in all kinds of shells is, in nearly all cases, a high grade of black powder. Few of the higher explosives are suitable for this purpose. Any of the compounds of nitro-glycerine or other explosives which are liable to detonate by shock are manifestly unsuitable. Many deteriorate in long storage, and acids will react with the metal walls of the projectile. Picric acid or its salts, alone or in combination with other substances intended to make it less sensitive to detonation, are much used in the form of the Japanese shimose and the British lyddite. Great care must be exercised with these, however, to prevent the explosives coming in contact with the metal surface of the shell.

### The Canadian-Made Article.

In Fig. 2, the left-hand figure represents a typical 18-pound British shrapnel shell such as, along with 15-pounders, are, at present, being made in large quantities in Canadian factories. The body is forged by hydraulic pressure from a solid billet of high grade steel, and the machining represents two simple series of operations on turret lathes. After the finishing of the machine work and inspection, the cases are subjected to a heat treatment and oil quenching.

The brass cap which screws into the steel body and carries the fuse is turned from the rough casting in four turret lathe operations and is fitted with a brass plug for the purpose of protecting the thread until the fuse, which is made at the Government Arsenals is screwed in place. The fuse is kept from becoming loose and screwing out by means of small grub screws.

The central pipe carrying part of the explosive charge is of drawn brass tubing cut to length; shouldered and threaded to screw into the steel plate at its lower end, and is soldered into the brass cap at the top. The powder is contained in a tin cup which is formed accurately to fit the inside of the base of the shell. This means simple press and soldering operations. The bullets, which are about one-half inch in diameter and, of which 364 are required for each shell, are made of a mixture of lead and antimony and are formed cold in dies under presses. The copper rotating bands are rolled to size and are fastened in place by means of a closing press for the purpose. The interstices between the bullets are filled with a matrix composed of certain forms of pitch or other inflammable substances designed to protect the bullets from deformation when the shell is being discharged from the gun, and to indicate by its smoke, the exact point where the explosion of the shell takes place.

All the work in connection with the making up of the shell need not be done in a single plant or by a single firm. They are completed with the exception of the bursting charge and addition of the fuses, and are packed in special wooden crates designed to hold six each for shipment. The distribution of the contracts for the manufacture of shells in Canada is in the hands of a special shell committee, and the difficulties encountered in placing, collecting, assembling and inspecting the wide variety of the work involved are much greater than is realized by the man not directly in touch with the task. Some seemingly insurmountable obstacles have been met and overcome and, at the present time, the work is being done almost entirely in Canada, by Canadians, creditably alike to the latter and to the Empire of which they form a part.

## MANUFACTURE OF SHRAPNEL.

THE machining of shrapnel shell cases, while apparently an easy task, presents a problem which demands much careful consideration, especially with regard to the tool arrangements for the various operations. In the manufacture of these cases, the accepted English practice is to make them from very tough material in the form of hollow forgings.

As regards physical properties, the steel from which they are made has to fill very exacting requirements. The finished shell case is more than a piece of steel bored and turned to certain dimensions; it must be capable of withstanding roughly a pressure of 14 tons per square inch from the explosion of the cartridge which drives it out of the gun. Further, there is a charge of powder in the base of the shell, which, when exploded, either with a time or percussion fuse, bursts open the head, and forces the bullets out of the case; this bursting charge exerts a pressure of about 10 tons per square inch. In addition, there is an enormous torsional stress, caused by the rotation of the shell under the action of the rifling in the bore of the gun.

From the foregoing it will be seen that the case is necessarily made from a high tensile steel, which, in practice, generally has a carbon content of about 0.75 per cent. This material is tough, and exceedingly difficult to machine; in fact, even with the best grades of super-high-speed steel, it is impossible to turn it at more than 30 to 35 ft. per minute. One of the postulates, therefore, in the design of the cutting tool is that they shall be simple in form, and easily removed and reset when grinding becomes necessary.

### Two Distinct Systems.

When embarking on the manufacture of shells it is possible to proceed by

either of two very distinct courses. The first and older way is to install a plant of simple machines, each one being designed to perform one simple operation, the shell being passed from machine to machine until completed. The objection to this course is, however, the large amount of equipment required, necessitating large workshops and a great number of men. In addition to this, plants laid down on these lines are comparatively useless for other work, so that the capital spent upon the machines is likely to be unproductive when the demand for shells disappears.

The second course is to install machines of high productive capacity, consisting of a suitable combination of engine lathes with capstan or combination turret lathes. Such a plant occupies less floor space, requires a correspondingly less expenditure on buildings, and requires a smaller number of men. It also has the very great advantage that when the demand for shells ceases it is still entirely suitable for the manufacture of general work by modern productive methods.

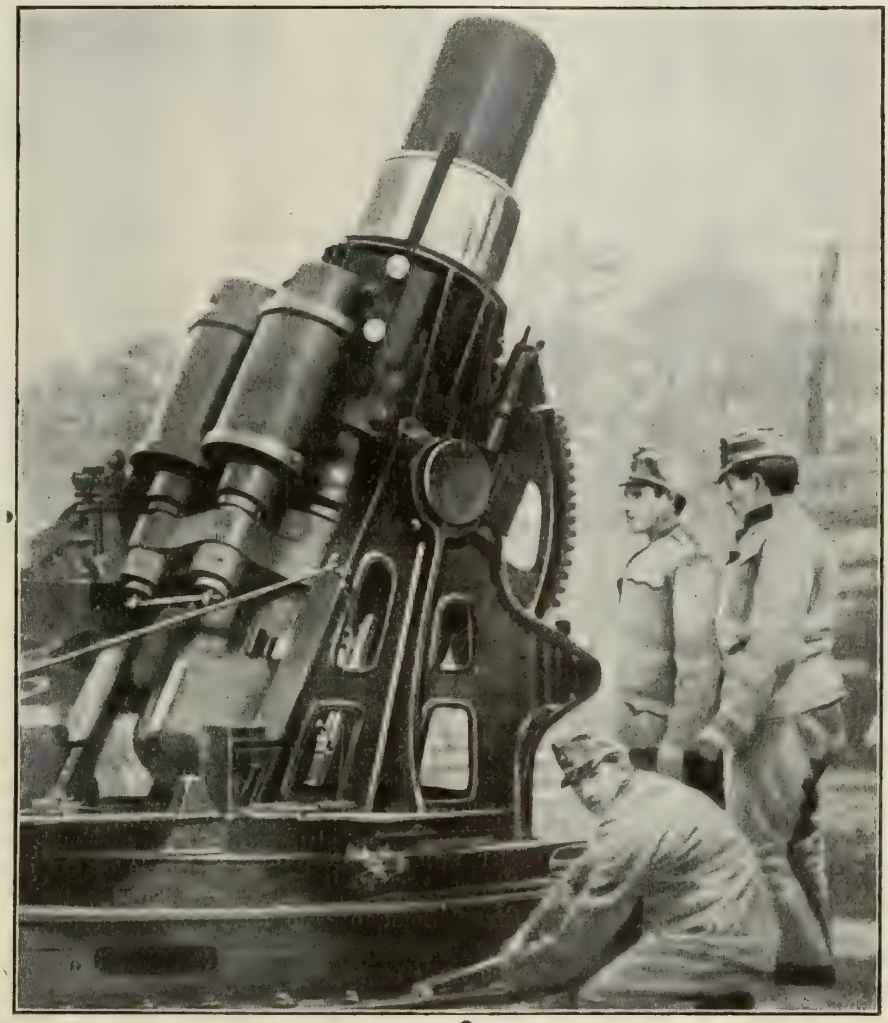
The great demand for projectiles caused by the war has led many engineers to take up shell manufacture who had no previous experience, with the result that the cost at which shells are produced varies astonishingly in different works. Some makers producing the same article are working for a bare living, where others, by the use of better methods, are making a handsome profit at equal contract prices.

The proper course to adopt is to consult manufacturers and suppliers of engine lathes and turret lathes who know what is wanted in shell manufacture. Where sufficiently full particulars are furnished it is possible for such leading machine tool firms to give a guarantee of output, and to make the purchase of the plant dependent upon the fulfilment of these guarntees.

## NOTES ON ORDNANCE.

THE action and conditions existing in a modern heavy gun were described graphically some years ago by a president of the French Society of Civil Engineers. In the case of a gun firing, in two minutes seven shells, each weighing 660 lbs., the 3,200 cubic feet of gas produced by 220 lbs. of smokeless powder develops in the gun bore a maximum pressure of nearly 18 tons per square inch and subjects the breech mechanism to a load of 2,600 tons.

Under the action of these gases (lasting 75-10,000ths of a second) the projectile leaves the muzzle with 40,000 foot-tons of energy, and is able to pierce 22 inches of steel two miles away. The gun and the moving parts of its mounting weigh 47 tons and recoil 3 feet in a quarter of a second, their motion being checked by the 200 tons resistance offered by a hydraulic buffer, so that the speed of recoil at no moment exceeds 22 feet per second (15 miles an hour). At the same time, the running-out gear stores energy to return the gun to its firing position in three seconds.



THE 12-INCH SIEGE HOWITZER OF THE AUSTRIAN ARMY.

This 30.5 centimeter Howitzer is capable of elevation up to 65 degrees, recoils 6 ft. at each discharge, and fires a shell weighing over 1,000 lbs. The barrel weighs 6½ tons, and the total weight, including recoil equipment and mounting is a little more than 28 tons.

—Courtesy Ill. London News.

So excellent is the braking and recoil gear on modern field guns that six to twelve rounds or more can be fired without "re-laying" the weapon. Nevertheless, due to variable windage, imperfect balance in shell walls, variable resistance offered by the driving band to the rifling, variations in the force of explosion and varying recoil jump, it is impossible to ensure two rounds hitting exactly the same spot, and the "sheaf of fire" of an 18-pounder quick-firing gun at 2 miles range is about 85 yards by 5 yards.

Theoretically, a gun barrel should be so long that the gases expand completely by the time the shell leaves the muzzle, but in practice a shorter barrel (25 to 35 calibres in the case of a field gun) is employed for obvious reasons. Smokeless powders, as now invariably used, maintain high pressure behind the shell so long as it is in the barrel and thus impart maximum energy to it. Black powder generates high pressure very quickly, but does not maintain its driving action so well.

Heavy British guns are built on the wire-wound principle, but most other nations use the shrunk-on tubular construction. Forged steel is then used, typical specifications for inner tube, jacket and hoop materials being:—Elastic limit, 46,000, 48,000, 53,000 lbs. per square inch; tensile strength, 86,000, 90,000, 93,000 lbs. per square inch; with elongation, 17 per cent., 16 per cent. and 14 per cent. respectively.

It will be noticed that the weakest material is used for the tubes, which are actually exposed to highest stress in working, the explanation of this anomaly being that the highest specification could hardly be met in the heavy forgings required for gun tubes; also, greater elongation values are obtainable in the lower limit steels, and are, of course, desirable in the heavily strained tubes.

## RANGE FINDING AFLOAT.

"A RANGE FINDER on a battleship, is an ingenious optical contrivance which gives the observer who looks into it exactly the view he would have if his eyes were twenty-one feet apart," says a U. S. navy officer. An enemy's ship, therefore appears as if seen from two points of view separated by that distance.

"This line, twenty-one feet long, represents the base of an imaginary triangle, the apex of which touches the hostile vessel. The instrument shows the two angles at the base of the triangle, which, together with the known length of the base, give the distance of the enemy's craft, or in other words the range.

"There are three or four other range finders in various places, on top of the turrets or elsewhere, each instrument being erected on a tripod. The observations of all of them are communicated by telephone to the plotting room, which is under the water line of the ship. There the whole problem is worked out on a mathematical basis, but with the utmost celerity, and thence the proper ranges for the guns are sent to the turrets.

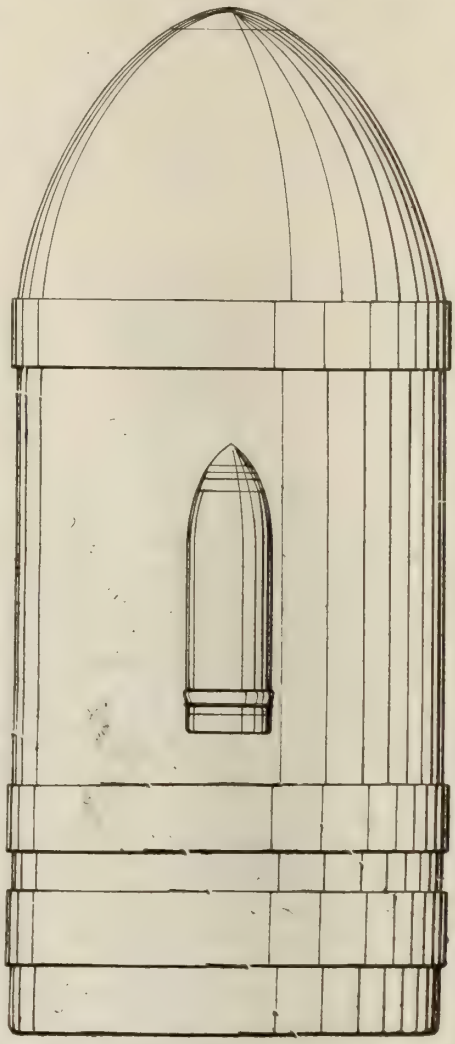
"Officers of exceptional cleverness are employed in this kind of work, on which so much depends. The spotting room is provided with all sorts of instruments, including a master dial, with a switch which, when turned to one figure or another, causes corresponding figures to appear on dials in all of the turrets.

"It might be said incidentally that the range finders give ranges that are only approximately to be relied upon, because various conditions may affect the shooting. Thus, for example, gunpowder does not give in damp weather the same propelling force to the projectile as in dry weather. It is particularly at long range that the finders are useful. At short range the gunners are able to get along very well without their help, each turret officer doing his own spotting and correcting his range by observation of the fall of his shells.

"The fighting of the ship is directed by the captain from the conning tower, in which are the steering wheel, a compass, voice tubes, engine signals, and telephones communicating with all parts of the vessel. It is he who gives the order to open fire on the enemy, who governs the steering of the vessel, and who indicates when torpedoes are to be discharged."

## RANGE OF NAVAL ACTIONS.

ONE of the uncertain points in naval warfare is the range at which an action between battleships of hostile fleets would take place, and this is a question that has yet to be solved. In the Russo-Japanese war the range was frequently 5,000 yards, but since that time the size and accuracy of the guns have increased, and it is generally considered that 8,000 to 10,000 yards, will be the distance at



GERMAN 42 CENTIMETER (16½ INS. IN DIAM. X 39½ INS. LONG) GUN SHELL WITH BRITISH 18-POUNDER SHRAPNEL SHELL INSET FOR COMPARISON.

the present time. Some of the later battleships have guns with a longer range than 10,000 yards (notably the 13.5 in. and 15 in. types), but it is doubtful if in the North Sea, even in clear weather, ships could be properly seen when beyond this limit, and it is not at all unlikely that the lower figure of 8,000 yards (or something under five miles), will represent the distances between the capital ships in a naval battle.

A 12-in. gun (50 calibres) would almost certainly penetrate the armor of any British or German warship at 10,000 yards, and it may appear from this that the employment of the 13.5 and 15-in. models is therefore valueless. This would be so were it not for the fact that the weight of the charge in the larger calibre projectiles is much increased, with a corresponding effective destructive value of the shell. The number of rounds that can be discharged is also considerably more in the 13.5 and 15-in. weapons owing to the lower velocity of discharge, and whereas only 150 to 200 shells can be fired with the 12-in. 50-calibre gun, from 400 to 500 are possible with the 13.5-in. and 300 to 400 with the 15-in. type.

## ENGINEERING ACHIEVEMENT OF THE WAR.

SIX months after the beginning of the campaign we are all surprised to see how splendidly Britain has risen to the front rank of military powers, having now a trained army easily comparable in total fighting power with the more laboriously collected conscript forces of our Continental friends and enemies. The Grand Fleet has given us time to improvise an army, having raw material of the finest quality and having an unsurpassed engineering industry to carry out its equipment. The general strategy of the allies becomes more obvious as we reckon up the items that constitute our strength in the field and on the ocean and at the same time make allowance for what we were short of at the start and have not yet fully attained.

Our enemy is now firmly held, but when we have properly armed our striking force, our generalship will select the most suitable area for the purpose and will crush the enemy by sheer weight of men and material. It is the engineering trade of the country that is largely responsible for the approach of that decisive period.

**Toronto Technical School Equipment.**—Contracts for the supply of the bulk of the machine tool equipment called for by the management of the Toronto Technical School have, we understand, been distributed between the A. R. Williams Machinery Co., Toronto; the Canadian Fairbanks-Morse Co., Toronto; the Canada Machinery Corporation, Galt, Ont., and the John Bertram & Sons Co., Dundas, Ont.

# Machining Shrapnel Shell Cases, and the Tools Employed

By F. H. Mayoh

*Just as there is a wide distribution of orders for the machining of 18-pounder shrapnel shell cases, in like manner will there be more or less diversity in method and procedure adopted relative to their quality and quantity output as finished products. A thoroughly practical demonstration of how to achieve the desired end profitably is given in accompanying article.*

SHRAPNEL shells are of varying size and form to suit the weapons from which they are discharged, and to accord with the ideas of experts of each individual government. As in other spheres of modern mechanical engineering practice these shell products manifest high degree accuracy being of necessity interchangeable as regards classification and the weapon to which they pertain.

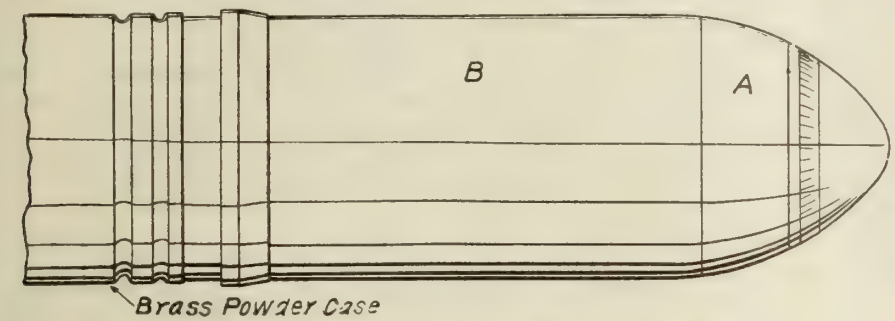

FIG. 1. SHOWING GENERAL APPEARANCE OF SHRAPNEL SHELL.

Taking up first the manufacture of the shell case which contains the various units, reference is made to Fig. 3, which shows a shrapnel shell case in detail, the operations on which consist in making the case complete from a bar or forging.

The operations on this case involve boring the hole, turning the outside, forming the various shapes, grooving and cutting off. All of this is accomplished on different types of standard machines by various arrangements of tools and layouts suitable for the turret lathe.

Fig. 4 illustrates the first operation where A is a bar of steel gripped in a three-jaw lever chuck B. Below and designated as 2nd T.F. are tools which drill two sizes C. turn outside D, rough face end E, cut groove F, and start to cut off G; these tools being held in the turret holes and a turning tool holder bolted to the turret. Following this, the turret slide travels back clear of the work, and the turret indexes bringing another set of tools into position for finishing, the previous set of tools being known as roughing tools. The finishing tools consist of boring tool or reamers which form and bore inside of case H, finish turning tool I, and blade J, which counterbores the end slightly. These tools are held similarly to the roughing-in holders K and L.

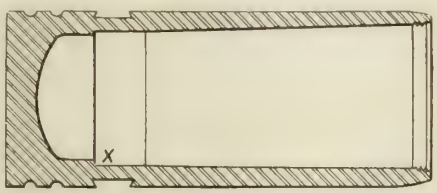

FIG. 3. DETAIL OF SHRAPNEL SHELL CASE.

The turret again indexes and a short thread is cut in end of case by tap held in 4th T.F., while the case is cut off with blade M on rear cross slide. On the 1st T.F., it will be noted that a short drill P is held, the object of this being to spot face the bar of steel, thus making a short hole so that the long drill on the 2nd T.F. will start true. The operations briefly stated are:—Spot face, rough drill two diameters, rough turn, rough face end, cut wide groove, and start to cut off; finish out hole two diameters, counterbore, finish turn, tap and cut-off case.

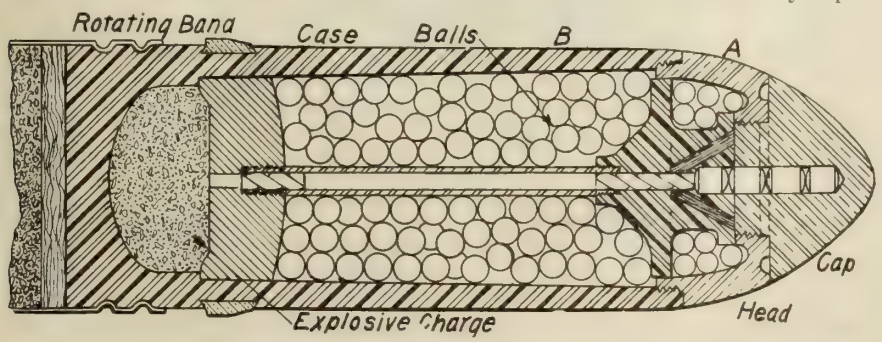

FIG. 2. SECTION THROUGH SHRAPNEL SHELL.

Having completed the bulk of machining on the case we now place it on a suitable arbor in the turret lathe to take the remaining cuts. This arrangement is shown by Fig. 5., from which it will be noticed that the shrapnel shell case slips over the arbor A, fitting on the ring X where counterbored slightly. It is also screwed in the thread a short distance. The closed end of the case is now gripped central by means of the expanding bushing B, which in turn is caused to expand by means of the taper Y and a draw-back rod operated by a hand wheel through the spindle, thus causing the expanding bushing to securely bind the end. The parts to be machined at

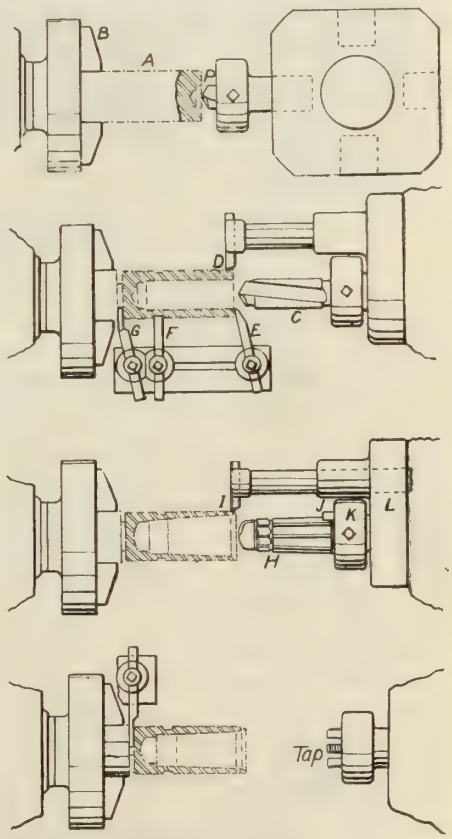

FIG. 4. TOOL SET-UP FOR FIRST OPERATION—FIRST TO FOURTH TURRET FACE.

this setting are the grooves, the curve at the open end and facing the end nearest the turret. For these operations no cutting tools are mounted on the turret, the cross slide being used exclusively for this purpose, although a bracket carrying

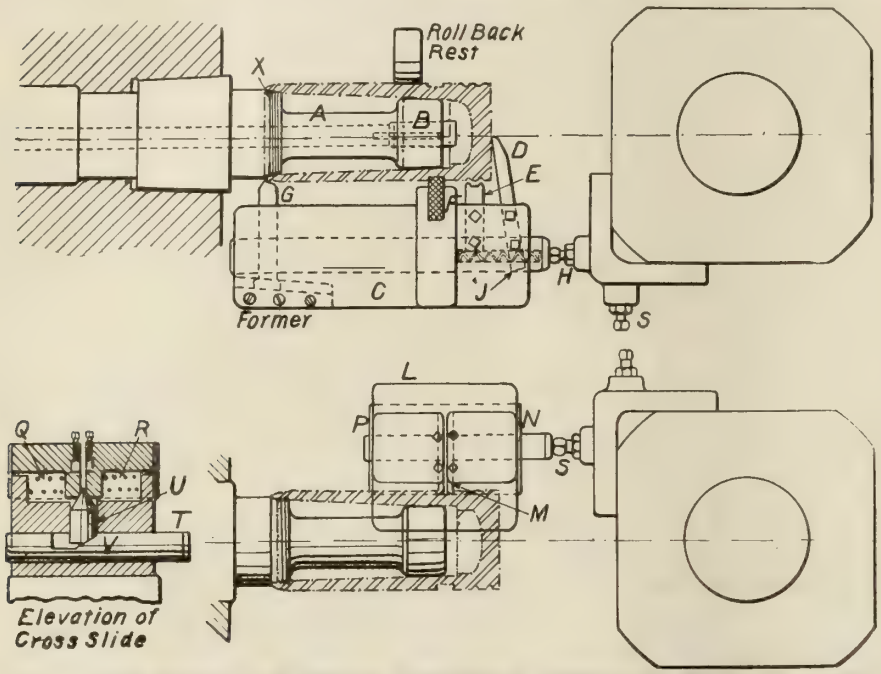

FIG. 5 TOOL SET-UP FOR SECOND OPERATION, FIRST AND SECOND TURRET FACE.

push screws to operate the cross slide tools is mounted on the turret.

Referring to Fig. 5, after gripping the work, the front cross slide block C carrying blades is fed in, the blade D faces the end, a blade or blades E form the grooves, and a roll F knurls the wide groove which was machined in the first operation. At this time, still another blade G, forms the curve at the open end of the case in the following manner:—When the cross slide carrying the tool has fed in the required distance for grooving, it is held in that position by a special cross slide feed lock, while the

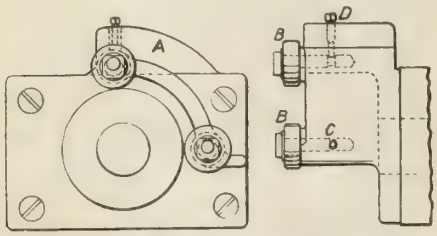

FIG. 6. TYPE OF ROLL REST SUITABLE FOR SUPPORTING CASES.

screw H in a bracket on the turret pushes a bar J through the cross slide block in the direction of the arrow, thus advancing the blade G along a former which conforms to the shape to be cut; this former being inside the cross slide block.

Following this, the turret indexes from the first to second turret face and another block on the rear side of the cross slide L comes forward carrying two blades M, which are held in two separate blocks N and P, which are free to slide in the block at right angles to the movement of the cross slides. As this block comes in, the blades are held close together by means of springs Q and R, thus allowing them to enter the groove previously formed. When the blades reach the bottom of the groove, the cross slide dwells as previously described and the turret comes forward until the screw S in the bracket engages the plunger T. This in turn pushes up plunger U by means of the angular surface V, and plunger U pushes apart the slides N and P by having its point tapered, thus undercutting or dove-tailing the groove to the desired shape.

As the turret returns, the springs push the two slides together, the cross slide returns to its original position and the piece being now complete is removed from the machine. Briefly stated, this second operation is as follows:—Place on arbor, face end, cut grooves, form open end with single point tool, knurl and cut dove-tails.

It will be noticed in Fig. 5, that a roll is shown at Z, this roll being part of a suitable back rest shown in Fig. 6. It consists of a holder A, two rolls B, and two eccentric studs C for holding the rolls, the idea of the eccentric studs be-

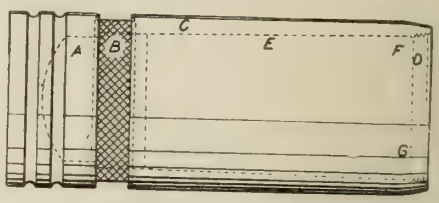

FIG. 7. SHRAPNEL SHELL FOR MACHINING ON SCREW MACHINE.
Operations—Feed stock; rough holes A and B; turn C and groove; finish hole A; counterbore D; ream taper E; tap F; face end G; finish hole B; knurl H; cut-off I.

ing to enable the rolls to be set up to the work by turning them, the eccentric throw acting as an adjustment which carries the rolls in and out against the work, and, when the correct adjustment is obtained, the studs are bound by the screws D.

### Machining Forged Shells

In addition to the methods outlined above for machining, shells are quite often made from forgings, in which case the procedure is very similar. The case is gripped over the outside for the first operation, and the periphery is turned at the second holding; a cutting off tool is of course unnecessary.

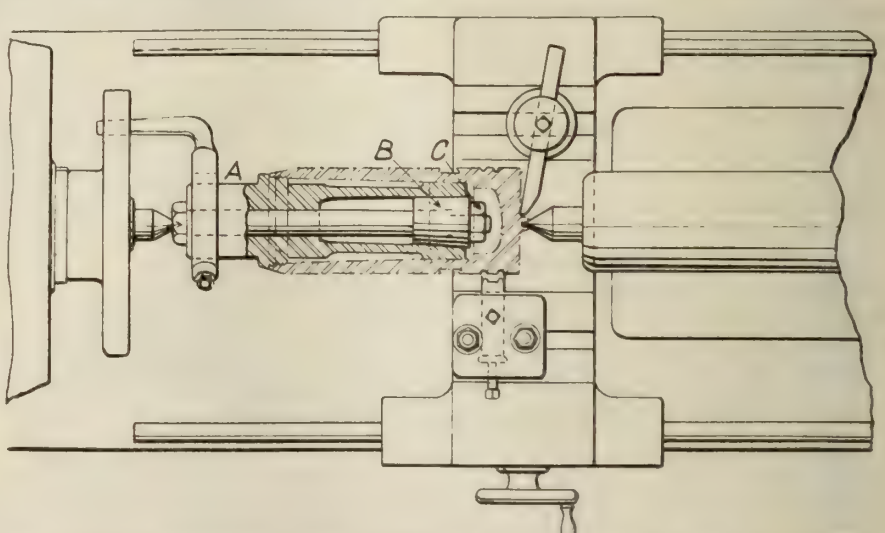

FIG. 8. SET-UP SHOWING ARBOR SUITABLE FOR HANDLING CASES BETWEEN CENTRES.

While it would be impossible to refer here to the many methods in use, most of which vary but slightly from the foregoing on the smaller sizes of shrapnel shells, a screw machine is quite often

used where the operations involved would likely be rough turn outside and face solid end, cut grooves and knurl; this completing the first operation with forged blanks. The second operation detail would be grip on outside diameter with special holder or true running chuck with soft jaws, form and bore hole two cuts; face to length, and tap. In making these pieces from the bar on a screw machine, we would first feed stock against a stop in the first turret hole, rough out hole two sizes, turn and groove, finish formed hole for powder at closed end, counterbore end, ream tapered hole, tap, face end, finish large hole at end of taper X, Fig. 3, knurl and cut off. These operations are plainly marked on the sketch of the case, Fig. 7.

It frequently happens in making up shrapnel shell cases that an engine lathe or some other type of lathe is used. Where it is desirable to swing the work between centers for the second operation, an arbor suitable for the purpose is shown by Fig. 8. This is of the expanding type. The body A, of the arbor is split in three places and is caused to expand by the sleeve B and the tightening of the nut C. In service a dog is placed on the end of the arbor, and with a shell in position as shown, the necessary cuts are taken.

## BIG GERMAN GUN A MYTH.

THE stories of the monster German guns that were to bombard the English coast from Calais and other French places do not seem to have upset the naval mind much, and the attitude is a pretty logical one. Guns and gunnery have been the navy's pet subjects for some long time past, and it flatters itself that what it does not know about heavy guns is not worth knowing. When, therefore, it hears of a 16.8-inch gun that will fire a 2,500-pound projectile twenty-eight miles it simply smiles.

A British naval gunnery man deals with the subject thus: "The Germans know everything about our guns that is worth knowing: their extreme range, every foot-ton of muzzle energy they possess, and their muzzle velocity to the fractional part of a foot-second, and they also know that their own naval guns are not so good; that is one of the main reasons why they are sticking in harbor instead of coming out to fight us. Our naval guns are the product of a long course of development; it took years to develop the 50-calibre 12 inch and the modern 13.5-inch was only possible from the experience gained in that development, just as the 15-inch developed from the 13.5-inch.

"Mr. Churchill said of the 15-inch: 'its power may be measured by the fact that whereas the 13.5-inch guns hurls a 1,400-pound projectile, a 15-inch discharges a projectile of nearly a ton in weight, and can hurl this immense mass of metal ten or twelve miles.' Is it possible then to imagine that, if Germany has a gun able to hurl a projectile twenty-eight miles, her navy would be gunned as it is? That Germany may have a 16.8-inch gun firing a projectile of 2,500 pounds no one doubts, but if it can hurl it ten miles that is about the extreme range. So, at least, says the navy, and it should know something about the subject."

## SMALL ARMS OF BELLIGERENTS.

NO two of the European armies now engaged in war are equipped with the same rifle. The French and Austrian forces are using the largest calibre instruments found on the Continent, while the latter, at the sacrifice of velocity, is employing the heaviest bullet. The German rifle attains the greatest muzzle velocity, but this is partly on account of the fact that it uses the lighest projectile shot by any small arm in Europe.

The longest rifle in service belongs to the Russian equipment, while the French have the longest bayonet, a thing which gives their weapon the greatest total length and, therefore, an advantage in charging. The shortest gun is that of the British army, and, with the bayonet added, the instrument is still shorter than those of any countries, except Belgium and Austria. Owing to the small size of the gun, however, it may be handled with ease.

### The British Arm.

The Lee-Enfield 303-calibre rifle, firing a cupro-nickel bullet weighing 215 grains, with a muzzle velocity of 2,060 feet a second, and using a propelling charge of 31.5 grains of cordite, is used by both infantry and cavalry of the British. Although experiments have recently been conducted with a sharp-pointed projectile, the round-nose bullet is still being used. The weapon is 3 feet 8¼ inches in length and takes a sword bayonet 17.2 inches long, which gives it an aggregate length of 5 feet 1.7 inches. Its magazine capacity is 10 cartridges, which is larger than that of any other gun now being used.

### The French Arm.

The French troops carry the Lebel magazine rifle of .315 calibre, which fires a pointed bullet with a boat-shaped tail, made of a copper and zinc composition and weighing 198 grains. The propelling charge is 46.2 grains of nitrocellulose powder and hurls the bullet from the rifle with a velocity of 2,380 feet a second. In length the weapon measures 4 feet 3⅛ inches, and its sword bayonet 20.72 inches, giving it a total length of 5 feet 11.84 inches. Including the bayonet the weight of the gun is 10 pounds 1½ ounces, which is greater than that of the arms carried by any of the other troops. The magazine holds five cartridges.

### The Russian Arm.

Russian fighting forces are armed with the "three-line" Nagant .30-calibre rifle, which is 4 feet 3⅞ inches long and uses the old-style triangular bayonet of 17.2 inches in length, giving the piece a total length of 5 feet 9 inches. The ammunition carries a propelling charge of about 49 grains of pyroxiline, which shoot a cupro-nickel shell, round-nosed, weighing 214 grains, at a muzzle velocity of 1,985 feet a second. With its bayonet the gun weighs 9 pounds 11¼ ounces, while its magazine capacity is five cartridges.

### The Belgian Arm.

A .301-calibre Mauser rifle, firing a round cupro-nickel shell of 219 grains, with a velocity at the muzzle of 2,034 feet a second, is used by the Belgians. The propelling charge consists of 37 grains of nitrocellulose powder. In length the rifle is 4 feet 2¼ inches and its bayonet 9½ inches, which gives it an aggregate length of 4 feet 11.75 inches.

### The German Arm.

Germany has a .311-calibre Mauser rifle, which fires a pointed projectile made of nickel-coated steel, weighing 154.5 grains. It uses a propelling charge of 48.4 grains of nitrocellulose powder and throws the bullet at a muzzle velocity of 2,882 feet a second. In length the rifle is 4 feet 1.4 inches, while the bayonet, 20.61 inches long, gives it an aggregate length of 5 feet 10 inches. It weighs 9 pounds 14 ounces.

### The Austrian Arm.

Austria-Hungary equips its troops with the Mannlicher rifle of .315-calibre. This fires a round lubricated steel bullet weighing 244 grains, which is sent from the gun at a velocity of 2,034 feet a second by a propelling charge of 42.44 grains of nitrocellulose powder. The weapon is 4 feet 2 inches in length and has a bayonet 9.5 inches long, which gives it a measurement of 4 feet 11.5 inches in length. The magazine capacity of the gun is five cartridges, the same as that of the German Mauser rifle.

### Range Features.

The Russian "three-line" Nagant rifle has a maximum effective range of 2,096 yards. The Belgian, French and German rifles fire 2,187 yards effectively. The Austrian weapon has a range of 2,132 yards, and the Lee-enfield rifle of the British forces one of 2,160 yards.

# Development of Our Nickel-Copper Smelting Industry

By A. W. G. Wilson *

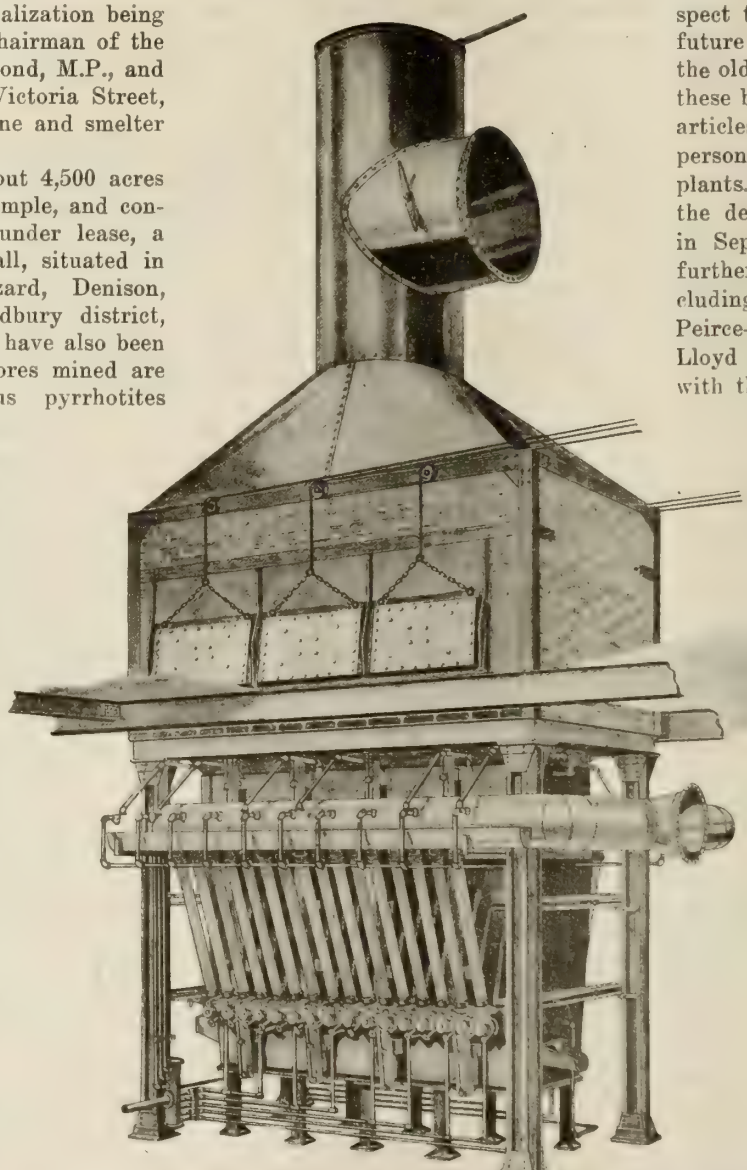
*The accompanying article is the third of a monthly series descriptive of Canadian nickel-copper smelting plants. The European War has brought this particular industry very much into the limelight, on which account information relative thereto is of more than ordinary interest and moment. Section 3 of this description of the Mond Nickel Co. organization will deal with the Company's refining plant in Wales. Data and cuts are by courtesy of the Canadian Department of Mines and represent conditions existent in the fall of 1913.*

## MOND NICKEL CO.—I.

THE Mond Nickel Co. was incorporated September 20, 1900, under the laws of Great Britain, and operates in the Province of Ontario under license. The original capital of £600,000 sterling has been twice increased, the present capitalization being £2,400,000 sterling. The chairman of the company is Sir Alfred Mond, M.P., and the head office is at 39 Victoria Street, London, England. The mine and smelter office is at Coniston, Ont.

The company owns about 4,500 acres of mining lands in fee simple, and controls about 2,500 acres under lease, a total of 7,000 acres in all, situated in the townships of Blezard, Denison, Snyder, and Garson, Sudbury district, Ontario; additional areas have also been acquired recently. The ores mined are deposits of nickeliferous pyrrhotites containing some chalcopyrite, and occurring in norite; they contain about 2.3 per cent. nickel and 1.75 per cent. of copper in addition to small amounts of gold, silver, platinum and palladium. For many years the principal property was the Victoria Mine, first openened about 1890. Two ore bodies, about 160 feet apart, occurred on this property. They lay with their longer horizontal axis almost on an east and west line, and had a uniform dip of about 75° towards the east. Development work was by diamond drilling, followed by shaft sinking and the running of levels. The main shaft is a 3-compartment shaft, 800 feet in depth, 4 ft. x 12 ft. inside the timbers; ten levels have been driven from this shaft to reach ore body.

The other important mine which has supplied ore for a number of years is the Garson. There are two ore bodies at this mine, about 100 feet apart, and the development and mining have been through a 500 ft. shaft. Extensive diamond drill work, based on the results of magnetic surveys, has shown the existence of a large body of ore on property belonging to this company, adjacent to the Frood Mine, Lot 6, Concession VI., Township of McKim. Preparations have been made to mine this ore body on a large scale.



RECTANGULAR WATER-JACKETED COPPER BLAST FURNACE. ORIGINAL TYPE USED BY THE MOND NICKEL CO., 1909, VICTORIA MINES SMELTER (A.C. CO.).

The company also owned and operated a smelter at Victoria Mines, Ontario, on the Soo branch of the Canadian Pacific Railway, about 2 miles from the Victoria Mine, and 22 miles west of Sudbury; but the operation of this plant has now ceased, there having been erected to replace it a modern and fully-equipped plant at Coniston, about 7 miles east of Sudbury. The new plant is more conveniently situated with respect to railway transportation and the future ore supply. Descriptions of both the old and new works are here included, these being based upon several published articles and upon data obtained by a personal visit of the writer to the two plants. Relative to the plant at Coniston, the description represents its condition in September, 1913, since which date further equipment has been added, including another blast furnace, another Peirce-Smith converter, and two Dwight-Lloyd straight line sintering machines with the necessary auxiliary equipment.

The ore supplied for the old plant was conveyed to the roast yards and thence to the smelter over a Bleichert aerial tram line, 11,000 feet in length. Ore from the Garson Mine was brought about 31 miles in 50-ton bottom dump steel railway cars to Victoria Mines; from here a portion was sent to the roast yards over the tram line and the balance went directly to the furnaces. Ore supplies for the new smelter are derived chiefly from the Garson and the Frood Mines, a portion of the ore body of the latter being on the property of this company. The haulage distances to the new roast yards, about a mile and a quarter from the smelter, are 10 and 12 miles respectively, chiefly over the Canadian Northern Railway.

Power for the Victoria Mine and smelter was furnished by a hydro-electric plant, owned by the company, and located at Wabagishik Falls, on the Vermilion River, in Lorne Township, and about 8 miles from Victoria Mines.

* Chief of Metal Mines Division, Ottawa.

Power for the Garson Mine was procured from the lines of the Wahnapitae Power Co., whose two power plants are located on the Wanapitei River not far from Coniston. The new smelter is operated by Wanapitei power.

### Historical.

In the year 1899 the company began operations in the Sudbury district by extensive stripping and other development work at the Victoria Mine. This included the building of roads, the preparation of a roast yard and other preliminary work. In 1900 the smelter was erected on its present site, under the supervision of Hiram W. Hixon. The Bleichert tram line, 11,000 feet in length, was installed by the Trenton Iron Co. of New Jersey to connect the mine, roast yards, and smelter. The furnaces were first blown in early in 1901. The mine and smelter were closed down in December, 1902, and were not again in operation, except for a few months in the summer of 1903, until near the end of 1904. Since that date the plant had been in continuous operation, with only slight interruptions. The first furnaces were 44 in. x 120 in. at the tuyères; in 1908 the plant was remodelled and the size of the furnaces increased to 44 in. x 180 in.

In 1911 a site was selected at a point about 2 miles from Romford Junction, on the Canadian Pacific Railway, conveniently located, both with respect to two transcontinental railway lines and to the principal mines owned by the company, and a new modern smelting plant erected. There are now installed three blast furnaces, 50 in. x 240 in., three Peirce-Smith basic converters. 10 ft. x 25 ft. 10 in., together with the necessary auxiliary equipment.

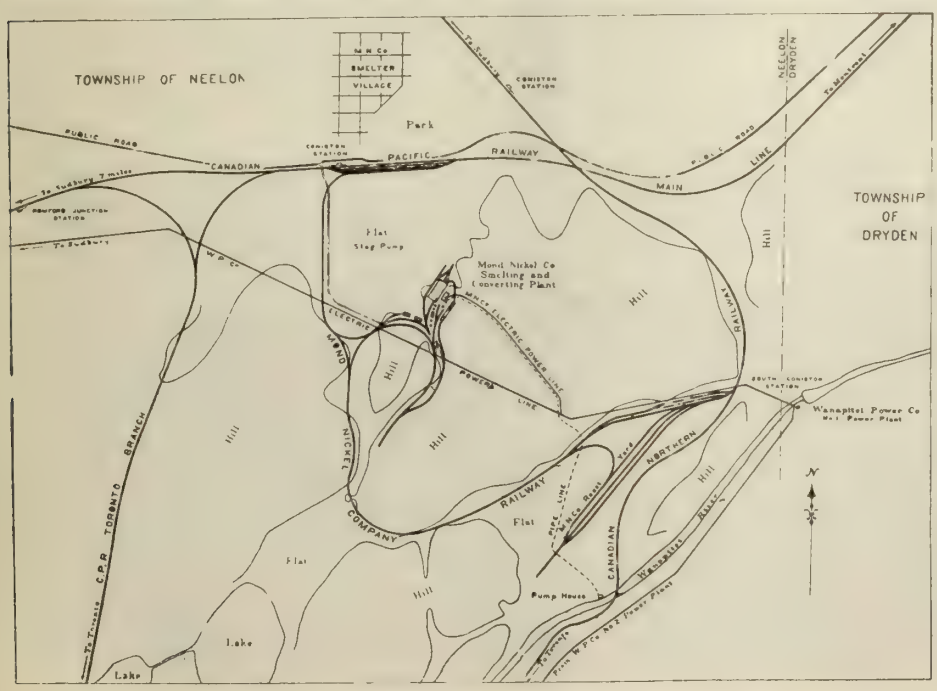
### Victoria Mines plant.

This plant, although having ceased operation, has, however, served its purpose well, having been an important factor in the development of the copper-nickel industry of the Sudbury district. A brief description of the equipment and the method of operation is of interest, and may also be of future value as a matter of record.

### General Statement of Equipment.

The plant was equipped with two water-jacketed blast furnaces, 44 in. x 180 in., each capable of treating 400-450 tons of ore charge per day, under present practice. In converter building were two electrically-operated converter stands, and 6 shells, each 84 in. x 126 in., and a 30-ton, 3-motor, Morgan traveling crane. Power was electric, supplied by the company's plant at Wabagishik Falls, on the Vermilion River, with a boiler plant held in reserve at the smelter. The blower plant included two Connersville blowers and a Nordberg compressor for the converter air. The buildings consisted of office and laboratory, engine house,* well equipped shops, club-house, boarding houses, and about 40 detached dwellings.

GENERAL VIEW OF THE COMPLETED PLANT AT CONISTON. NOTE THE CURVED LINE OF TRESTLES CARRYING THE TRACKS THAT RUN UNDER THE ORE BINS AND ON THE CHARGING FLOOR LEVEL.



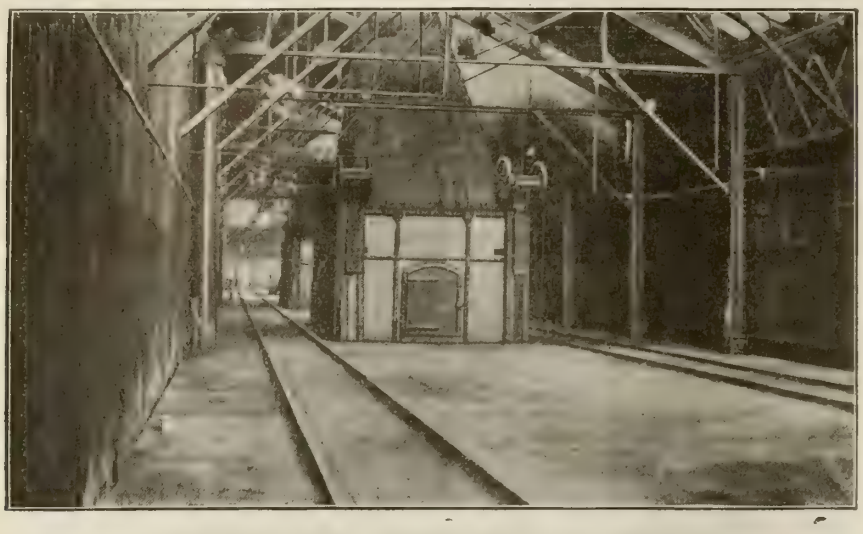
GROUND PLAN, CONISTON PLANT, MOND NICKEL CO.

Bleichert Tram Line.—This tram line was 11,000 feet in length and ran from the Victoria Mine to the smelter. It was equipped with loading terminals at the mine, at the roast yards, and at the smelter, and with discharging stations at the roast yards and smelter. The buckets each held about 700 pounds and travelled the two miles from the mine to the smelter at such a rate as to deliver about 100 loads per hour. The roast yards were located between the mine and the smelter and about half a mile from the latter. Ore from the Garson Mine was delivered into tram bins near the smelter by Canadian Pacific Railway ore cars; this ore being then raised by a small skip to charging bins on the tram line, whence it was conveyed to bins at the roast yard. The tram line also carried Victoria Mnie ore to the roast yards, roast ore to the smelter, and waste rock from the Victoria Mine to the dump. The operation of the tram line was such that each bucket was idle for only a very short portion of the entire round trip from Victoria Mine to smelter and return.

The difference in elevation between the mine and smelter was only about 160

*The power plant at Victoria Mines was destroyed by fire on the day before it was closed down for removal to Coniston.

feet, but owing to the heavy duties required of the tram, this fall was not sufficient to operate it, and additional driving power was furnished by a 30 h.p. motor installed at the lower end.



CHARGING FLOOR, SHOWING TOP OF A FURNACE.

Flue System and Stacks.—The downtakes of the blast furnaces led to a steel dust flue with continuous V bottom, and slides were provided on either side at about 4 ft. centres, for the removal of flue dust. The main stack was of steel plate, and about 115 feet in height. The lower part of the stack, about 24 feet in height, was shaped as a truncated cone, the upper portion being cylindrical. The converter flues connected with the main stack.

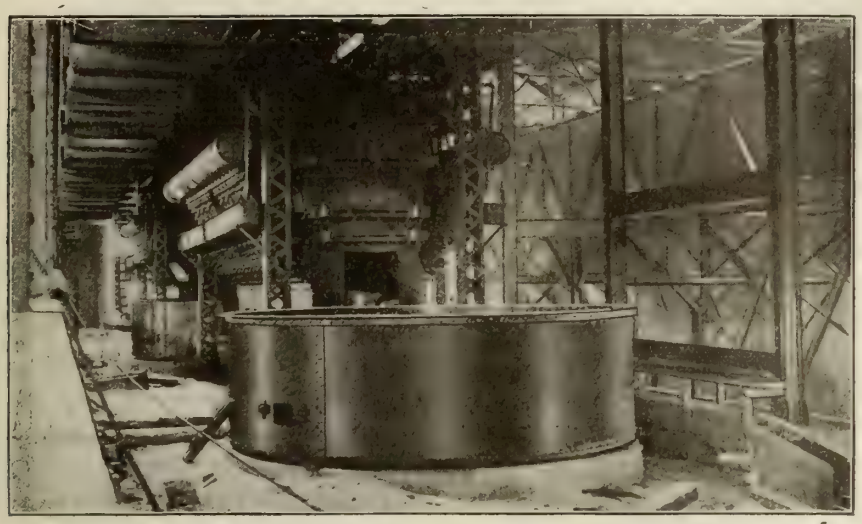
Buildings.—The smelter building was a steel frame structure, covered with corrugated iron sheeting, while the electrical sub-station, in which the power plant was also placed, was a wooden trussed brick building with concrete floors, 50 ft. x 90 ft. The roof was composite, being covered with corrugated steel on the outside and lined with matched pine. The various shops were housed in wooden structures.

Coke, Fluxes, Silica.—The coke used in the furnaces came from Pennsylvania, being shipped by water to Algoma Mills, 73 miles west of Victoria Mines, where it was loaded into box cars, or coke cars, and hauled to the smelter by the Canadian Pacific Railway. The freight charges amounted to about $5.60 per ton on coke that cost $1.10 per ton at the ovens. Limestone, which forms about 4 per cent. of the furnace charge, was obtained from the Fiborn quarries in Michigan. For converter linings, the siliceous ore from Bruce Mines, Ont., was used. This ore consists largely of quartz carrying about 3 per cent. copper in the form of chalcopyrite. The ore is hauled 121 miles over the Canadian Pacific Railway. When an additional supply of quartz was required, it was obtained from a local quarry not far from the smelter.

Blast Furnaces.—The two furnaces were each 44 in. x 180 in. at the tuyères, and were mounted on concrete foundations at an elevation of 6 feet above the converter floor. The superstructure was of structural steel above the charging floor; the hood, stack, and downtake leading to the flue being of steel plate. They were water-jacketed steel furnaces with brick tops, and cast-iron sole plate 2 in. thick. Their capacity was 400-450 tons of ore charge per 24 hours for each furnace, under the present method of operation.

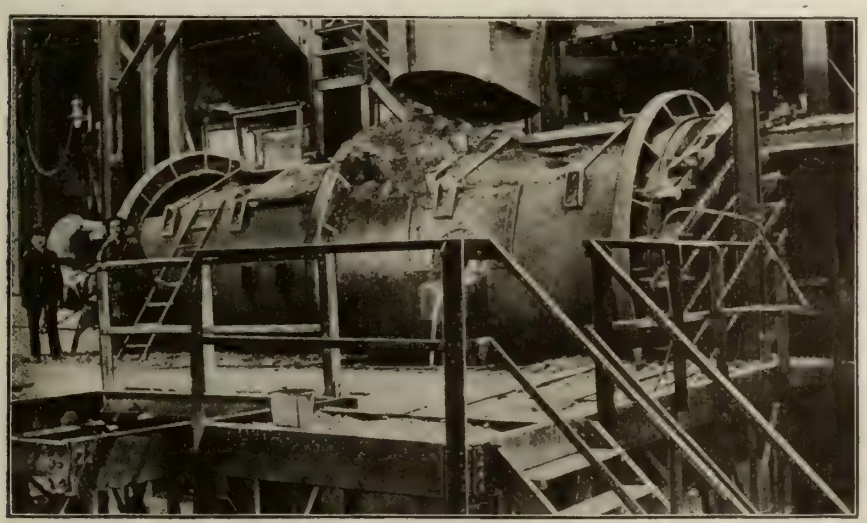
CONISTON PLANT IN COURSE OF ERECTION, MOND NICKEL CO., CONISTON, ONT.

The furnaces as originally constructed each consisted of two tiers of water-jackets, three jackets on each side to each tier. The upper tier had, however, been replaced by brick. The inside brickwork was of firebrick, and the outside



CONISTON PLANT, SETTLER ON FURNACE FLOOR.

of common brick. The furnaces were charged from the side, the charge doors being operated with a pneumatic lift. The charging floor was 14 feet above the tapping floor. The furnaces were provided with special water-cooled cast-iron spouts, each provided with only one set of water pipes, while the spouts were lined with chrome brick, similar brick being also used at the tap holes. The crucible was built within a plate steel box, and carried by the sole plate. Chrome brick laid in magnesite cement was used for this; the magnesite cement being mixed with magnesium sulphate water. The settlers were circular, each



CONVERTER IN OPERATION, CONISTON PLANT.

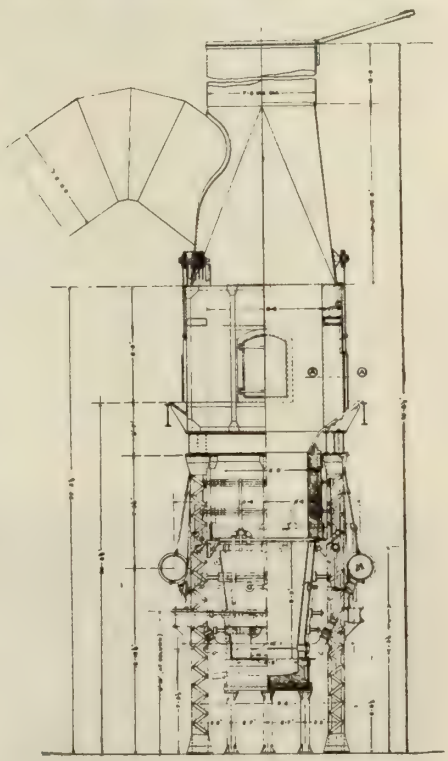
12 feet in diameter and 4 feet in depth.

Converters.—There were two electrically-operated converter stands and six Allis-Chalmers improved, 84 in. x 126 in. shells. The stands were operated from a pulpit by individual controllers and air valves, while the converter shells and 5-ton cast steel matte ladles were handled by one 30-ton 3-motor Morgan travelling crane. Lining for the converters was prepared by a 7 in. x 10 in. Blake crusher, and two 6 ft. Chilian mills direct connected to a 30 h.p. direct current motor.

Blower Plant.—Air for the blast furnaces was supplied by two Connersville blowers, each having a capacity of 15,340 cubic feet of air per minute at 40 ounces pressure, running at 130 r.p.m. Each of these was belt-connected to a 200 h.p. constant speed motor, taking current at 550 volts, and running at 580 r.p.m. The air pressure at the furnaces was about 38 ounces. Air from the blowers was delivered to a common receiver, and conducted to the bustle pipes of the furnaces. Bustle pipes ran along each side of each furnace and across one end.

Air for the converters was supplied by a Nordberg duplex air-compressor, capacity 6,000 cubic feet of free air per minute, compressed to 12 pounds pressure, at 82 r.p.m. The low pressure cylinder was 34 in. in diameter, and the stroke 42 in. The flywheel was 18 feet in diameter, and grooved for 18 ropes each 1.25 in. in diameter. The machine was driven by a constant speed 315 h.p. induction motor running at 345 r.p.m., receiving current at 550 volts. This blowing engine was fitted with mechanical inlet Corliss valves and poppet discharge, and was regulated by the air pressure from the receiver through floating levers to the governor, this controlling the cut-off on the Corliss inlet-valves.

Flue Dust.—Flue dust was drawn from the flue through the slide doors into a barrow. It was wetted and fed to the furnace from hand barrows.

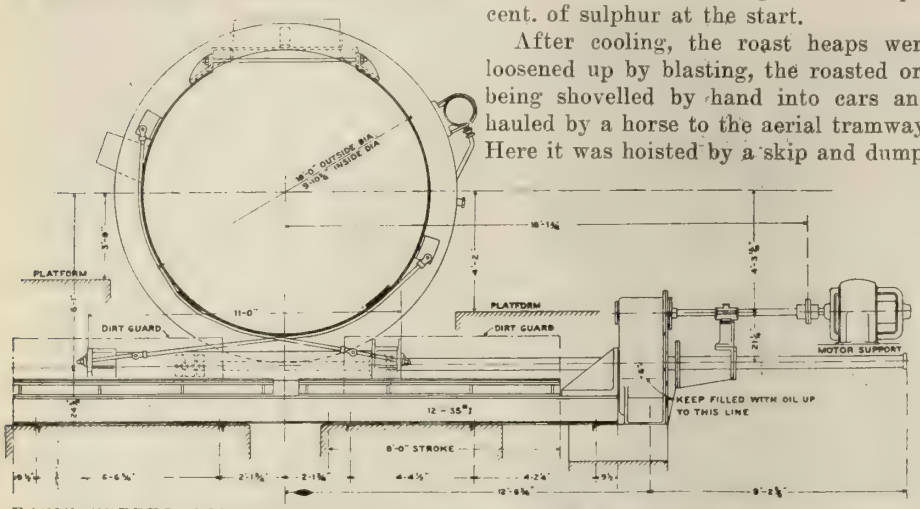


VERTICAL TRANSVERSE SECTIO OF COPPER BLAST FURNACE (A.C. CO.), 1912. MOND NICKEL CO.

Smelting Practice. Roasting.—About two-thirds of the ore treated was first sent to the roast yards, about half a mile from the smelter and north of Victoria Mines station. Green ore was received at the tramway unloading station in the roast yards and dumped in a pile. Here it was shovelled into buckets and hoisted to the level of the staging built over the roast yards, and loaded into end-dumping hand lorries, holding about 1,000 pounds each, these being pushed by hand to the roast piles. Each roast pile, when completed, contained about 3,000 tons of ore and covered an area of 40 ft. x 150 ft., the piles being built in a row, with the longer axis parallel, and

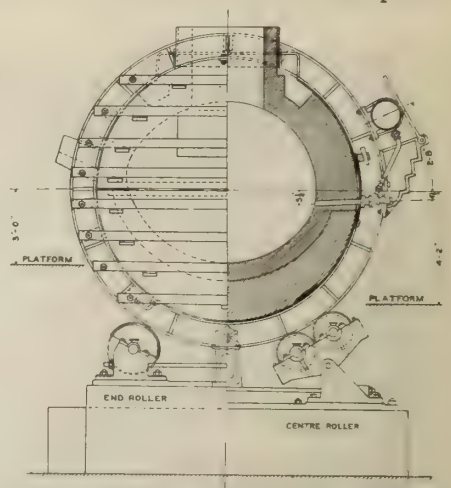
about 10 feet between piles. To build a new pile a light pole staging was erected over the roast bed, and rails were laid in this staging to accommodate the lorries. A bed of dry wood, about 3 feet in depth, carefully and properly piled, was then laid as a base for the proposed roast pile. Upon this wood ore was piled to a depth of about 10 feet. A top dressing of 8 in.-10 in. of fine ore was then spread over the top of the pile and down the sides and ends. The rails and stringers of the staging were afterwards removed, the poles being left standing in the pile. The wood of the pile was next ignited; the whole being alight in about four days. The pile was carefully watched, blow holes being stopped whenever they appeared, and the roast continued for about 100 days, by which time about half the sulphur had been burned out, the green ore containing about 20 per cent. of sulphur at the start.

After cooling, the roast heaps were loosened up by blasting, the roasted ore being shovelled by hand into cars and hauled by a horse to the aerial tramway. Here it was hoisted by a skip and dumped into the loading bins. Three men were required at the hoist in the roast yards; two men were required on each lorry; about 15 men in all being employed in these yards. The average output of the yards per day was approximately 475 tons of roasted ore, when the plant was operating at full capacity. All ore from the Victoria Mine was weighed into the roast yards at the mine, and that from the Garson Mine was weighed at smelter before being sent to yards. All roasted ore was weighed out of yards.

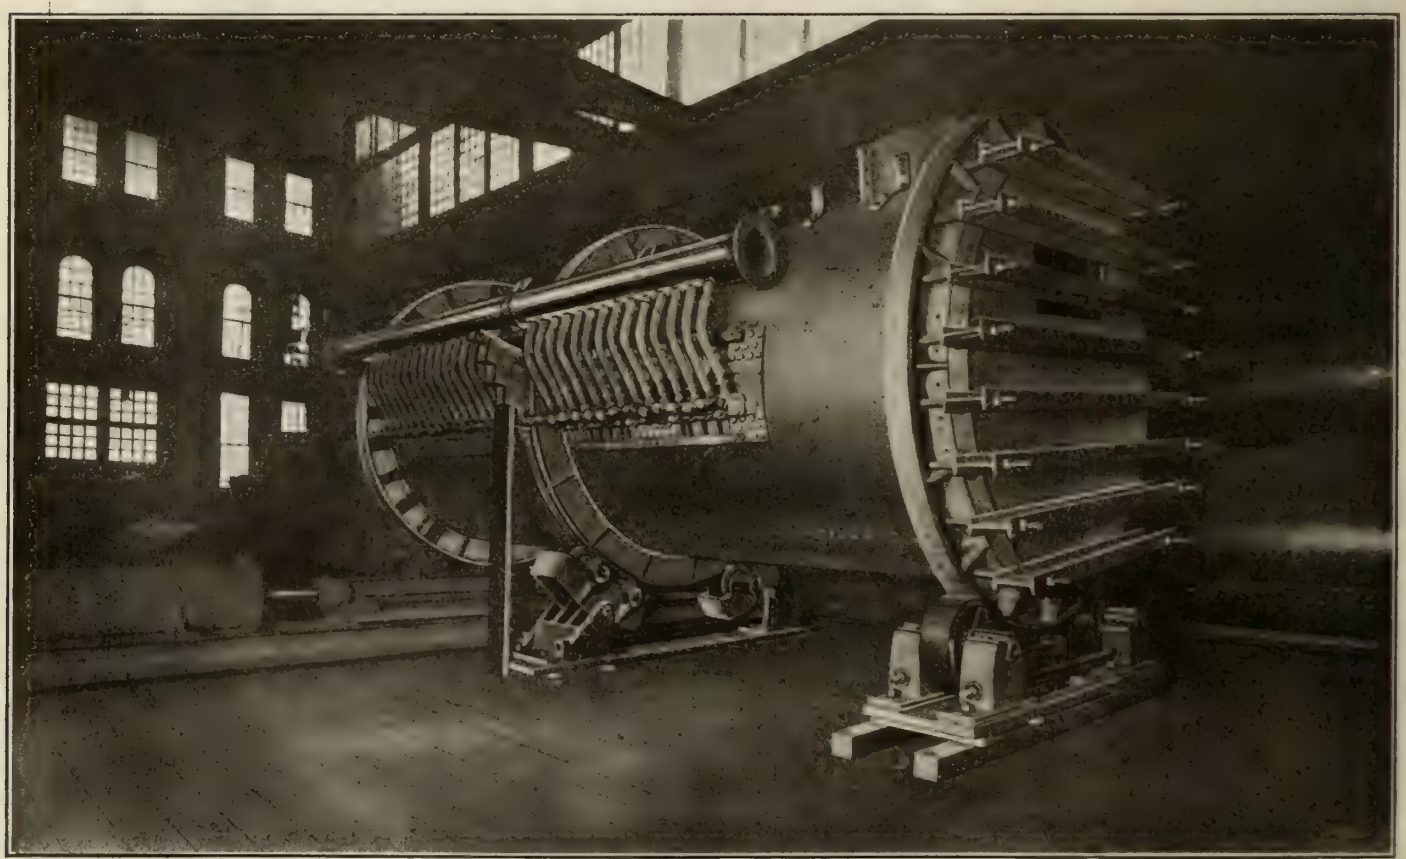


BASIC COPPER CONVERTER, PEIRCE-SMITH TYPE, MOND NICKEL CO. TRANSVERSE SECTION SHOWING ATTACHMENT OF TILTING MECHANISM (A.C. CO.).

Smelting.—At the smelter, ore, coke, and fluxes were all stored in bins placed with their discharge chutes above the level of the charging floor, so that the charge barrows would be run beneath them. The furnaces were charged by hand lorries holding about 800 pounds each. The ore charge consisted of two parts roasted ore to one part of green ore; the coke making up about 8 per cent. of the whole charge. A typical charge consisted of about 1,200 pounds



BASIC COPPER CONVERTER, PEIRCE-SMITH TYPE, MOND NICKEL CO., TRANSVERSE SECTION THROUGH WIND BOX AND TUYERE ON RING NEAREST THE TILTING MECHANISM (A.C. CO.).



PEIRCE-SMITH BASIC COPPER CONVERTER, CONISTON PLANT, MOND NICKEL CO

of roasted ore, 600 pounds of green ore, 300 pounds of scrap and slag, including 75 pounds of limestone and 250 pounds of coke. The practice was to granulate the furnace slag, which was then flushed out to the edge of the dump.

Converting.—The furnace matte, containing about 33 per cent. copper and nickel, was collected in the settlers, which were tapped at intervals. From the settlers furnace matte was run into pots, which were lifted by the travelling crane and charged directly into the converters. Matte from No. 1 converter was blown up to about 60 per cent. copper-nickel. It was then skimmed and the slag sent to the furnace settler while still hot and liquid. The matte from converter No. 1 was then charged to converter No. 2, and blown to about 80 per cent. copper-nickel. The slag from this converter also went to the furnace settler, and the matte run into a pot, from which it was poured on a matte bed to cool. There were four of these matte beds, each 4 ft. x 15 ft. It was customary to draw matte from the settlers at the same time as converter slag was being poured, thus preventing the overloading of the granulating streams.

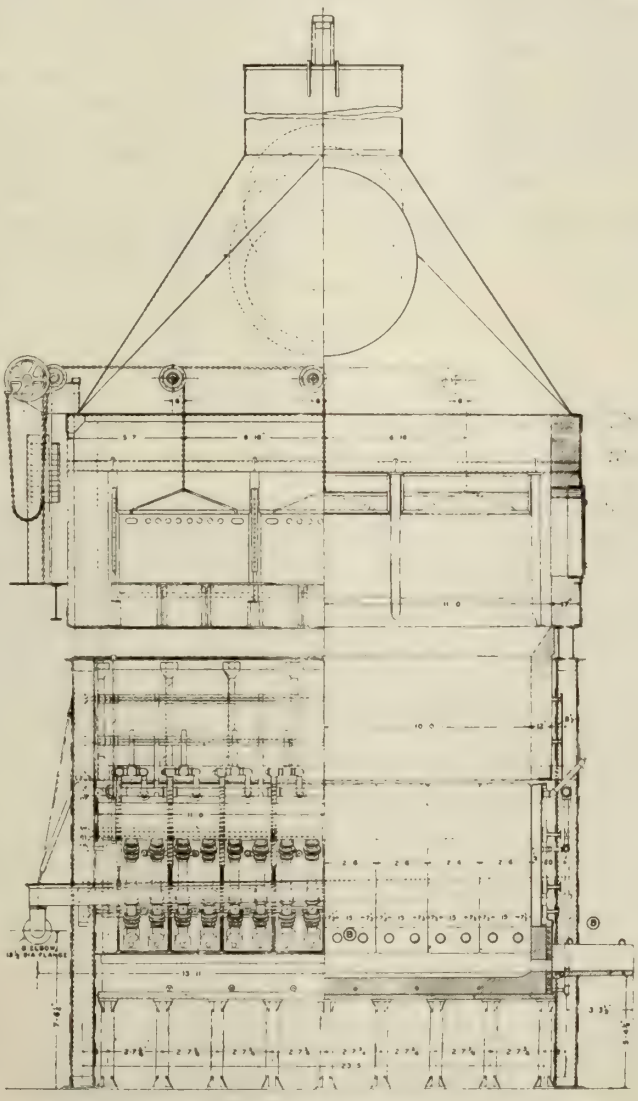
The final Bessemer matte produced contained about 38 per cent. copper and 42 per cent. nickel, and about 15 per cent. iron, the balance being sulphur and other impurities. It was broken up on the beds, put into barrels, and shipped to the Mond Company refining works at Swansea, Wales.

### Coniston Plant.

The site for the new plant at Coniston was chosen only after very careful surveys. The new smelter is located on a rocky hillside overlooking a large swampy flat, which gives ample storage room for large slag piles. The general layout of the plant and the railway approaches are shown on page 42.

The roast yards are located about three-fourths of a mile from the smelter, to the south-east, on the other side of the ridge at whose foot the smelter is placed. They are connected directly with the Canadian Northern and the Canadian Pacific Railways, and are also connected with the smelter by a spur line belonging to the company. A new townsite has been selected and laid out, north of the Canadian Pacific line and about one mile from the smelter. Coniston will be a model town provided with every modern convenience available.

General Statement of Equipment.—The main smelter building has a concrete substructure resting on bed-rock, and a structural steel super-structure. In this building are placed two new modern water-jacketed blast furnaces, 50 in. x 240 in., and two Pierce-Smith basic converters, 10 ft. x 25 ft. 10 in. Provision has been made for an additional blast furnace, which will be added when required. The power building is located on the hill above the smelter. The ore bins



COPPER BLAST FURNACE, 1912, MOND NICKEL CO. VERTICAL LONGITUDINAL SECTION (A.C. CO.).

are placed beyond this and a rock house stands south-east of the smelter and over the lower tracks. A semi-circular track leads from beneath the ore bins to the charging floor of the smelter building. It is carried over the slag tracks on steel trestles resting on concrete piers.

Receiving Ores.—As shown on page 42, spur lines have been built connecting both the Canadian Pacific and the Canadian Northern Railways with the roast-yards, the smelter yards, and the smelter ore bins. Ore from the mines to the north comes into the roast yards over the tracks of the Canadian Northern Railway and is delivered directly to the yards, or shunted over the company's spur line to the smelter bins. Ores from the west are diverted to the Mond Nickel Company's spur line at Coniston station, and can be run either to the smelter bins or on to the roast yards. Ore from the roast yards can also be conveyed over the spur line to the smelter bins on the high line above the smelter.

Power.—Power to operate the plant is entirely electric and is obtained from the power lines of the Wahnapitae Power Co. This corporation has two power stations on the Wanapitei River not far from Coniston.

Buildings.—The main smelter building is of steel construction with a concrete substructure, 90 ft. x 360 ft., resting upon solid rock; there is a monitor on the roof running the length of the building. A lean-to shed, 21 ft. x 240 ft., on the north-west side, houses the converter plant; a similar lean-to on the south-east, about 30 ft. x 210 ft., covers the slag track and the main flue.

A slag cut on the south-east side is provided with a standard gauge track. The tapping floor is 14 feet higher, and the charging floor 24 ft. 2½ in. above this. The furnace platform is 24 feet in width and 210 feet in length. The matte floor on the north-west side is 10 feet below the level of the furnace floor and about 56 feet in width.

The power house, built on the hill south-east of the smelter, is a brick and steel structure with concrete foundation and a tile roof.

Flue System and Stacks.—The main flue is rectangular in cross-section, 10 ft. x 15 ft., built of sheet steel. It leads to a dust chamber 30 ft. x 50 ft., built of stack brick, which connects with the base of the stack. The main stack rests on bed-rock. The lower 25 feet of the stack is square in section and is built of red brick, the upper cylindrical portion, about 16 feet in diameter, being built of Custodis stack brick. The height is about 175 feet.

**Montreal Ammunition Co.** has been incorporated at Ottawa, Ont., with a capital of $300,000, to carry on the business of manufacturers of ammunition, shells, bombs, etc., at Montreal, Que. Incorporators—E. E. Howard, J. DeWitt and H. C. McNeil, all of Montreal, Que.

# Manufacturing 18 Pounder Shrapnel Shells in Canada*

By John Preston**

*The accompanying article deals specially with the production of the British pattern 18-pounder shrapnel shell, and consists of an outline description of the procedure adopted in forging the shell case as well as that of the s bsequent machining operations. Reference is also made to the production of the shell cartridge case by Canadian concerns.*

THE majority of the "Made-in-Canada" shells are 18 pounders, and the following description will refer particularly to those of this size. In general this ammunition consists of a drawn brass cartridge case filled with a high explosive, and to the open end of the cartridge is fixed a bullet-shaped hollow steel case, usually referred to as the shell.

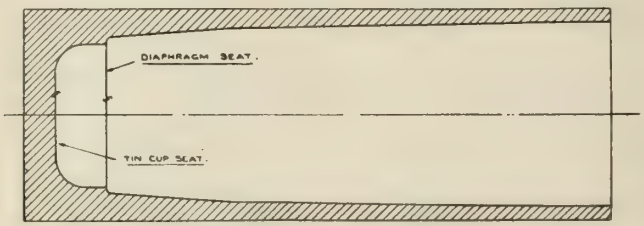


FIG. 1. THE 18-POUNDER SHELL FORGING.

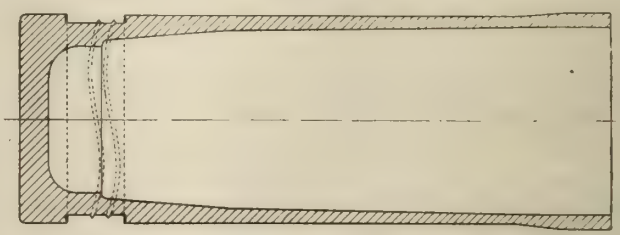

FIG. 2. THE 18-POUNDER SHELL PARTLY MACHINED.

By referring to Fig. 3, it will be noted the shell contains a charge of high explosive powder, A, segregated in a tin case with a sealed cover, B, and held in place by a steel diaphragm C. Ahead of the diaphragm the shell contains a number of lead bullets held in position with resin. A brass tube in the centre of the shell E is for the purpose of holding an extension of the time fuse, which consists of slow-burning powder F. It forms a passage for this fuse between the explosive charge and the detonator or time fuse at the nose of the projectile.

The brass tube is screwed into the steel diaphragm at one end and fitted into and soldered to a brass socket, G, which is screwed into the nose of the shell and also threaded to receive the time fuse and detonator. The explosive charge in the cartridge gives the shell a velocity of about 1,600 ft. per second at the muzzle, and the shell is effective for ranges of approximately 8,000 yards. The minimum range at which the shell may be exploded with the time fuse is, say, 100 yards, and this may be extended up to the full range of the gun. The time fuse is ignited by the gases from the explosion of the propelling charge, but, should the time fuse fail, the shell will be exploded on impact through the action of the detonator. The explosion of the charge in the base of the shell gives additional velocity to the bullets in a forward direction, and they are scattered over an area of considerable width.

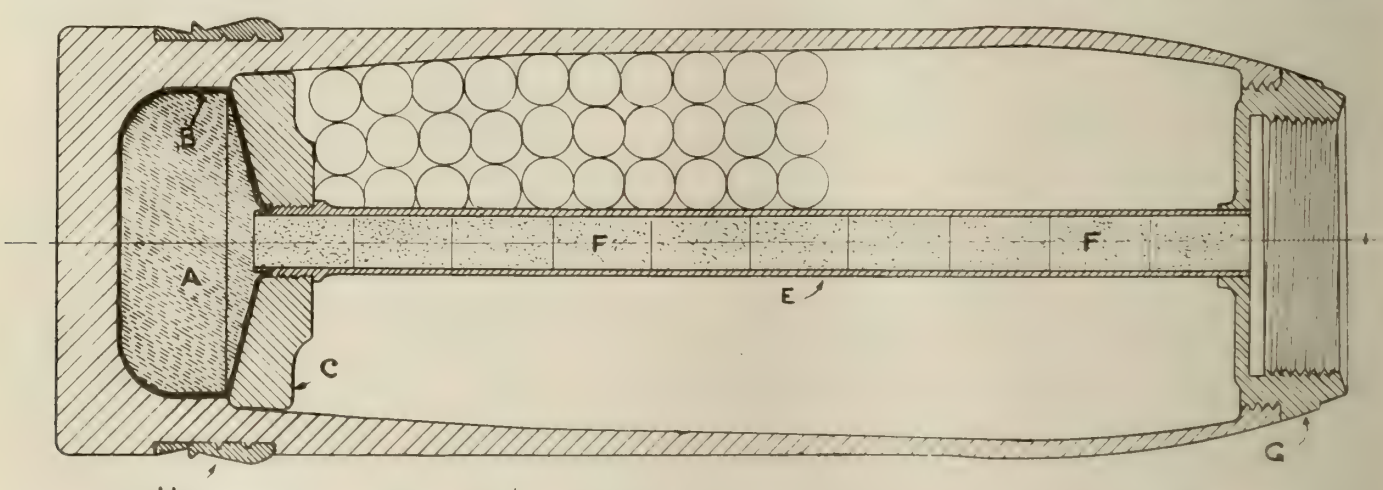

FIG. 3. SECTION THROUGH "MADE IN CANADA" 18-POUNDER SHELL ILLUSTRATING MAKE-UP DETAIL.

### Production Features.

In proceeding with the manufacture of these shells, 3½ in. round steel bars of suitable carbon content are selected, the specification providing that the steel after being annealed by heating to 1,700-1,800 degrees F., and cooled in powdered charcoal, shall pass the following physical tests:

(a)—Yielding stress—not less than 42,560 lbs. per square inch.

(b)—Ultimate tensile strength—not less than 78,400 lbs. per square inch.

(c)—Elongation—not less than 20 per cent. in a test piece 2 inches long and 0.564 inch diameter.

Forging blanks are prepared in lengths of 4½ in. by 3½ in. by cutting off the bars individually to the desired length in rotary bar parting machines or sawing off a number of pieces at a time by a cold saw fitted with special attachments for this purpose.

The forging of the shell is done in a hydraulic press of at least 300 tons pressure and having a stroke a little over thrice the length of the shell. It is advisable to have at least two presses and two heating furnaces so that the process of punching and drawing of the shells may be continuous. After heating the blanks in the first furnace, they are placed in a die and the first punching operation is proceeded with. This consists of forcing a round-nosed punch

*Courtesy "Industrial Canada."

**Supt. Ordnance Work... Nova Scotia Steel & Coal Co., New Glasgow, N.S.

having a diameter of about 3 inches into the blank to within about 1½ inches of the bottom. On account of the die holding the forging to the original diameter of the blank, the metal is forced upward around the punch so that when finished the forging has a length of approximately 8 inches.

After reheating, the punched blank is taken to the second press and fitted with a punch to the exact profile of finished forged inside dimensions of the shell. The forging is then placed over a die having an enclosed bottom, and forced against the die bottom with a punch and the tin cup and diaphragm seat formed. After reversing the press, this bottoming die is removed and the forging is forced through an open die which draws the shell to the proper outside diameter and length, the forging at this stage taking the form shown in Fig. 1, except that the ends are not trimmed. After this, the forgings are annealed and are then ready for the first machining operations. The usual practice is to part off the open end of the shell in a rotary barparting machine and face off the base in an engine lathe, or do these operations simultaneously in a cold saw equipped with a saw for parting and a milling cutter for trimming the base, the latter process being somewhat cheaper, as several shells may be trimmed at a time.

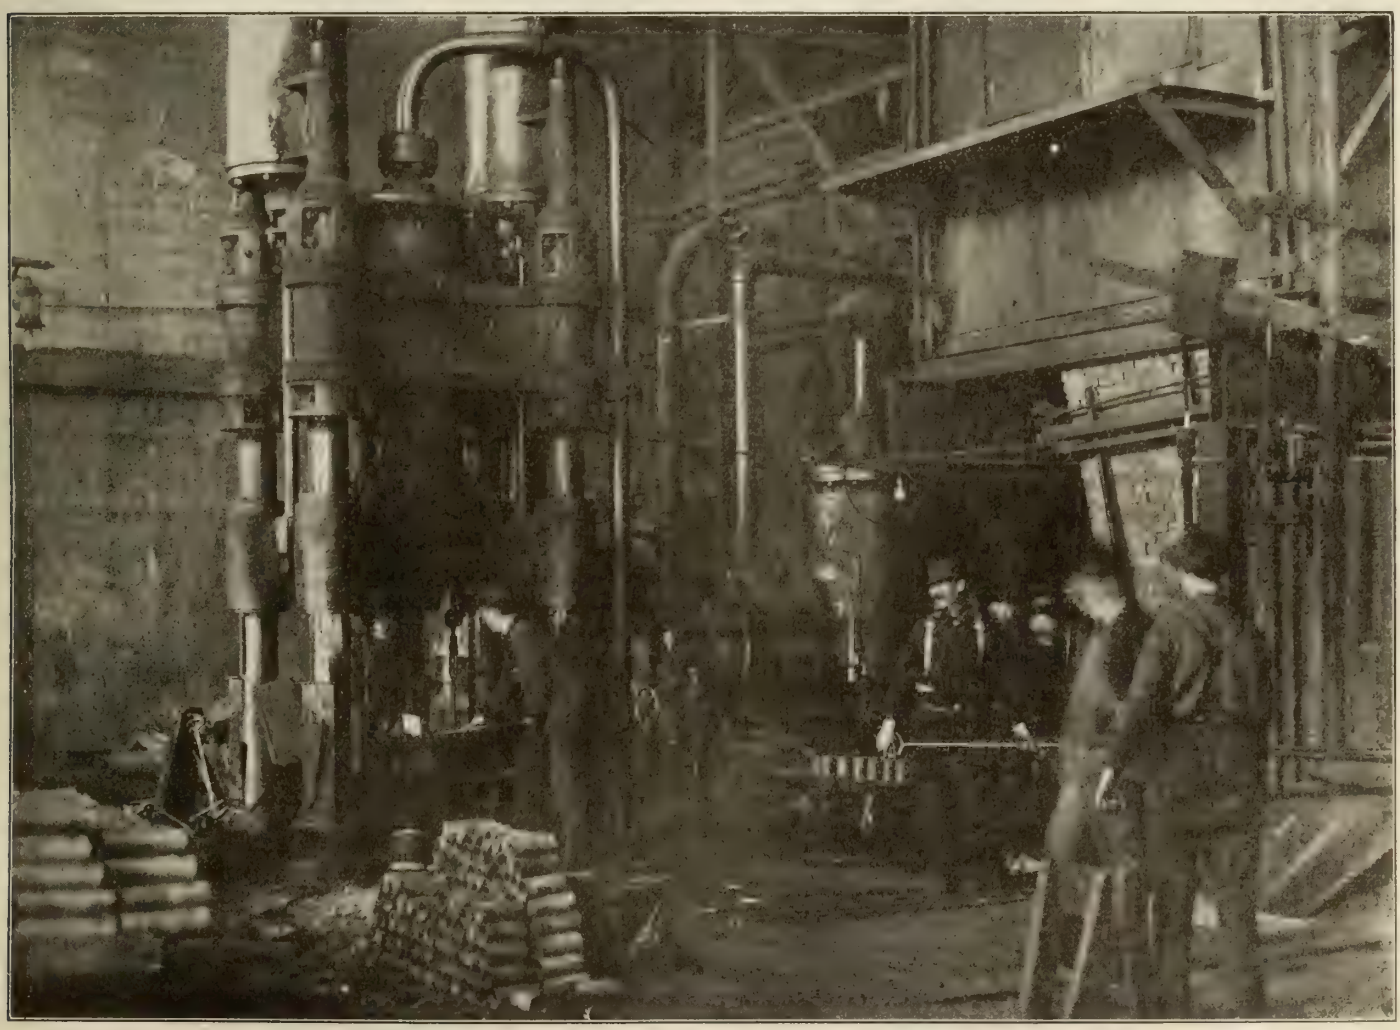
The second operation consists of rough turning the outside of the body and finishing the base and body up to the copper band groove, as shown in Fig. 2. This is invariably done in a hollow spindle lathe having a turret and fitted with an adjustable mandrel on which the shell is centred, so that the outside turning is maintained concentric with the inside forged surfaces. As it is necessary to have additional driving power over that furnished by the mandrel, the shell is gripped from the inside with a chuck and also driven by a clamp from the outside.

In some cases the groove and wave ribs for holding the copper band are also turned in this lathe, taking in consequence three independent operations to perform, while others do it on a separate lathe fited up with attachments to do the three operations simultaneously. The groove and wave ribs are shown at A in Fig. 2.

The third operation consists of finishing the inside for the tin cup and diaphragm seat, this usually being done with roughing and finishing cutters. The part of the shell left unfinished on the outside in the second operation is now completed, making it ready to proceed with either the groove turning, if this were not completed in the second operation, or the heat treatment, usually referred to as the fifth operation. This

**SHELL MANUFACTURE.**

**A point of interest to our business community, and the people of Canada generally, is that, until the outbreak of this war, with the exception of the Dominion Arsenal in Quebec, not one factory in Canada had ever made a shell. The result of the action of the Minister of Militia and the committee he has formed has been to initiate a great organized business industry in the form of shell manufacture. Canada has in this industry one of her strongest assets during war time.**



18-POUNDER STEEL SHELL BLANKS BEING FORGED BY AN HYDRAULIC PRESS AT PLANT OF NOVA SCOTIA STEEL & COAL CO., NEW GLASGOW, N.S.

treatment consists of heating the shell to a temperature depending on the carbon content and cooling in a tempering oil. The heating may be done in a regular heating furnace of the direct flame-heating type, using a flame having a reducing action or a furnace of the muffle type, which is preferable, or in a molten lead bath, the advantages of the latter being even heating and perfect exclusion of air from the piece being treated. They also heat quickly, consequently no burning out of the surface carbon is liable to take place. Lead bath furnaces being easily controlled will usually give more uniform results with less experienced furnace men.

In the latter method it is necessary to weight the shells to prevent them from floating, and it is advisable to arrange the lead pot so that the shells will maintain a stationary position. The heating is usually carried to a temperature of about 1,560° F., and after plunging in oil they are drawn at a temperature of about 900° F.

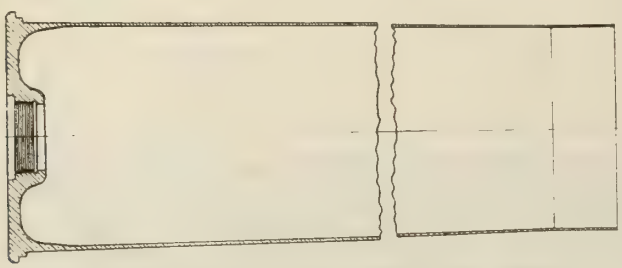


FIG. 4. CARTRIDGE CASE, 18-POUNDER SHELL.

The sixth operation consists of nosing the shell, that is altering the shape of the open end in a die from the form shown in Fig. 2 to that in Fig. 3. This is done by heating the nose for a distance of about 2½ in. in a lead bath, and after forming in a die, it is reheated at this point and annealed.

The seventh operation consists of turning the inside and outside of the nose and threading it to receive the brass plug. This is done in a lathe of the turret type, the boring and outside turning of nose being done on a forming attachment. The tapping may be done with a collapsible tap, but even with a solid tap it is necessary afterwards to tap out with a hand tap on account of the very narrow limits allowed on the threads.

The steel shell is now ready to be finished to final dimension on the outside, and this may be done in two operations, usually known as the eighth and ninth. This work may be done on two lathes, using one for turning the shell body and the other having a forming attachment is used for the nose.

An alternative arrangement is to finish this portion of the shell in a wet grinder, it having the advantage of greater outputs, particularly where the shells are harder than is necessary to give the required tensile tests; but the method so far is not much used.

The eleventh operation consists of pressing on the copper band H, Fig. 3. This is made from annealed copper tubing of sufficient size to slip over the butt end. It is usual to press the copper band into the groove with a special hydraulic press having six or more cylinders, the rams of which are fitted with hardened steel dies of the proper curvature to insure a close fit of the copper against the steel. For shells of this size it requires a pressure of from 30 to 40 tons to get the required results. It is important in this operation that the groove be quite free from oil scale or other foreign matter to insure proper contact. After this is completed, the band is turned to the correct shape by first roughing, and then finishing with a profiled cutter, thus completing the eleventh operation.

The shell is now ready for filling, and this is completed with the exception of the bursting charge. The shell diaphragm having been inserted previous to the nosing operation, it is possible to push the tin cup past the diaphragm to its proper seat, after which the diaphragm is pressed solidly into position and gauged for location. The brass tube E, Fig. 3, is then screwed into the diaphragm and maintained in alignment by a centering gauge, while the bullets are packed in position. The bullets are a composition of lead and antimony, and it is required that the shell contain at least 375, and their weight must amount to 9 lbs. 1¾ ozs. The adjustment of weight is obtained by the addition of not more than three or four buckshot. In order to prevent a movement of the bullets, which would destroy the balance of the projectile, the interior of the shell, after the bullets are included, is filled with melted resin, which hardens on cooling.

After the brass nose socket is screwed into place and the tube soldered where it passes through it, the nose is turned to correct shape in the twelfth operation. This is usually done in a lathe of the turret type with two profile tools. In this operation it is necessary to guard against the possibility of solder entering the brass tube or thread of the nose, taps and reamers being used to remove the solder should it be necessary.

During the process of forging and all machine operations, the shell is subject to inspection by Government inspectors, and following the twelfth operation there is a final overall inspection for defects in machining and weight. Following this, the shells are stamped, showing the size, date of manufacture, serial lot number, and manufacturer's name or trade mark. In doing this, it is usual to have a stamping machine, which greatly reduces the time of doing this work. The shells are then painted all over and again painted near the nose with some distinguishing mark, frequently in the form of a band in order to quickly distinguish the particular type of shell from all others of the same size, but different pattern. The body painting and painting of nose, when colored band is used, may be done to advantage in a small lathe and the shells placed in a heated oven to assure quick drying.

| Item | | Cut Strokes per Inches | Speed of Cut Strokes per Minute | Operation | Quantity of Operations in 8 Hours | Number of Pieces Finished in 8 Hours about | Number of Pieces Ground between Operations (Approx.) |

FIG. 5. DATA SHEET FOR CARTRIDGE CASES.

Following this, a brass plug is screwed into the brass nose socket to protect it against injury in shipping, the plug being removed when it is necessary to fill the shell with the explosive charge, and afterwards again removed when the time fuse is inserted immediately before firing. Where an order for shells only is in hand, this completes the work, and they are ready to be packed for shipment.

Specially prepared iron-bound wooden boxes are made up to accommodate six shells packed in a manner that will prevent all injury. The box is supplied with a cover, and a handle at each end gives means of easy movement. Should an order be received for fixed ammunition it is also necessary to supply the drawn brass cartridge, complete with detonator and explosive, and attach the shell to the cartridge.

In order to facilitate the drawing of the cartridge case it is usual to use an equipment of about eight presses, the

circular blank being gradually drawn into shape as it is worked through each press. Table in Fig. 5 shows a balanced equipment capable of turning out 2,700 cases in eight hours.

After the final pass is completed the dimensions of the shell barrel are correct for both inside and outside sizes, but it is necessary to machine both the inside and outside of the base in order to give it the proper shape at this point. After doing this, the shell is bored out and turned on the base and tapped to receive the detonator.

The brass cartridge cases are usually sent to the fixing plant of the manufacturer of the explosive to be charged, the shell inserted and secured—the combined cartridge case and shell tested as to correct length, etc., and assembled at some central point.

It is found in practice that the cartridge cases may be used several times in service before becoming sufficiently deformed that they are useless, so that it is usual when ordering fixed ammunition to order at least twice as many additional shells.

## MACHINE GUN FEATURES.

THE basic idea of a multiple or rapid fire gun of the class now generally known as machine guns is probably as old as the history of guns themselves. There is an old Chinese double-barreled gun in existence which, according to the inscription, was made in 1607, each barrel of which is provided with three vent holes so spaced that there is room for a charge of powder and a bullet between each vent. By this arrangement three shots could be rapidly discharged from each barrel, thus constituting a true rapid fire gun.

Since the time of this weapon many devices having the same object have been designed; but the first weapon that proved actually practical was the multi-barreled gun invented in America during the civil war by Dr. Gatling. This gun was operated by hand power, and was capable, in its improved form, of firing over a thousand shots a minute. It may be remarked that the original French mitrailleuse, so often referred to, was never very successful.

The modern machine gun has but a single barrel, and is, in its most improved form, entirely automatic in its action; that is, after the first shot has been fired it will continue to fire at a very rapid rate, all of the necessary operations of loading and firing being worked by either the recoil or by the pressure of the exploding gases within the barrel. While guns of the semi-automatic type have been made in fairly large sizes, the true machine gun is an automatic gun built to take only the regular service rifle cartridge used by the troops; and these guns operate at speeds of from 400 to about 1,000 shots a minute, depending largely on the size of the charge of explosive in the cartridge.

## BIG GUNS.

THE early stages of the military campaign in Europe demonstrated conclusively that the big gun was to play an important part in the contest for supremacy on land; and the minor conflicts at sea have shown that the same principle holds good there.

It is a noteworthy fact that the Germans did not pay particular attention to the development of guns of very large calibre for naval purposes, until just previous to the commencemnet of the war. Apparently they were quite satisfied with their 11 and 12-inch weapons, but in 1913 their ideas underwent a big change, and the vessels laid down in that year were to be fitted with 15-inch weapons, so that by 1918 Germany would have possessed a full division of ships armed with the new weapon. This gun was only produced by Krupp's after a series of failures, and after insistent demands by the big-gun school.

The heavy gun has proved its superiority, says the Liverpool Journal of Commerce, but Germany now finds herself in a position of hopeless inferiority from the ordnance point of view. Against Britain's 12-inch, 13.5-inch and 15-inch weapons the enemy can only reply with a large number of 11-inch and a few 12-inch guns. Size of gun is, however, not the only factor, for the method of manufacture is altogether different in the two countries.

The German gun is made by shrinking a number of cylindrical layers on top of each other, while the British guns are known as wire wound, that is, a number of the layers are replaced by winding on miles of wire. The Germans have held to their special type, because they considered that our weapons lacked longitudinal strength. This, however, is one of the many points which this war should definitely settle.

### CANADIAN SHELL COMMITTEE.

**The personnel of the committee entrusted with the placing of orders for shells, etc., and the inspection and shipment of same is representative of both Canadian military and manufacturing interests, and is individually as follows:**

**David Carnegie, M.I.C.E., Ordnance Advisor.**

**Col. Alexander Bertram, Chairman of Committee.**

**Brig. Gen. T. Benson, Master General of Ordnance.**

**Lieut.Col. Thomas Cantley.**

**Lieut.-Col. C. G. Harston, Chief Inspector of Arms and Ammunition.**

**George W. Watts.**

**Lieut.-Col. F. D. Lafferty, R.C.A., Supt. Dominion Arsenal.**

**E. Carnegie.**

**The Shell Committee Headquarters is Drummond Building, Montreal.**

## NEW TYPE BRITISH SUBMARINE.

ACCORDING to recent Admiralty notices the submarine W8 will shortly be commissioned, with Lieut. B. A. Beal in command. The submarines designated with the letter W were built by Armstrong-Whitworth & Co. at Elswick, and are of the Laubeuf type of design originated by the well-known French engineer of that name. They differ from the ordinary British submarines in that they have a greater reserve buoyancy, and are more of submersibles than submarines. It was understood that there were only four of these boats to be constructed, and the names given to them were W1 to W4. The meaning of W8, therefore, is not quite clear. These vessels were generally believed to be comparatively small craft of about 500 tons, although their speed is probably quite high.

The difference between this type of craft and the ordinary Vickers design (such as is followed in practically all other British submarines) lies in the variation mentioned above in the reserve buoyancy—that is to say, the difference between the submerged and the surface displacement. In the ordinary British submarine of the largest type, having a submerged displacement of 810 tons, the surface displacement is about 720 tons, leaving a reserve buoyancy of 90 tons, or about 11 per cent. In the Laubeuf type of submarine, whilst the submerged tonnage is 550, the surface displacement is only 400 tons, giving a reserve buoyancy of 27 per cent.

It is generally considered in France that this large reserve buoyancy is a necessity for good sea-going qualities and, as in spite of the relatively small size, many or more torpedo tubes can be carried in these boats and their speed is equal to the larger craft, they may be considered quite as valuable as any of the other vessels.

**Canadian Pig Iron Ore.**—Most of the ore used for the manufacture of pig iron in Canada during 1914 was imported from Newfoundland, only 182,964 tons being the product of Canadian mines.

# Shrapnel Shell Grinding Methods Briefly Outlined

By C. O. Smith*

*It will no doubt be of interest to our readers to learn that, while finishing shrapnel shells by turning is being practised by a great many of the firms having contracts to fill, grinding equipment is also being utilized to advantage in producing shells of accurate finished size and form. The accompanying article features some interesting details of the grinding process.*

WHILE the manufacture of shrapnel shells has been carried on in all parts of the world with a medium degree of efficiency by relatively few concerns, the present demand is so great and urgent that large numbers of mechanics are undertaking to manufacture them. This naturally brings out many ideas as to methods and also leads in many cases to much misunderstanding and expensive surprises. Some are finishing to size and form entirely by turning. Others, again, are sizing and forming a part of the exterior by grinding, while a number more are sizing and forming the entire exterior by the latter means.

The drawings furnished to the manufacturers and tool builders have shown very large limits for size and form, and have led all concerned into much misunderstanding, for while all have naturally based their estimates—prices and guarantees, on the figures given on these drawings, it has developed, as the production proceeded, that not only must the sizes be almost exact, but the form also. This has not only made it impossible to produce by any of the various methods as many per hour as was anticipated by their advocates, but has led many to adopt grinding as a means of securing the necessary accuracy with the view to obtaining the largest production with the smallest cost of labor.

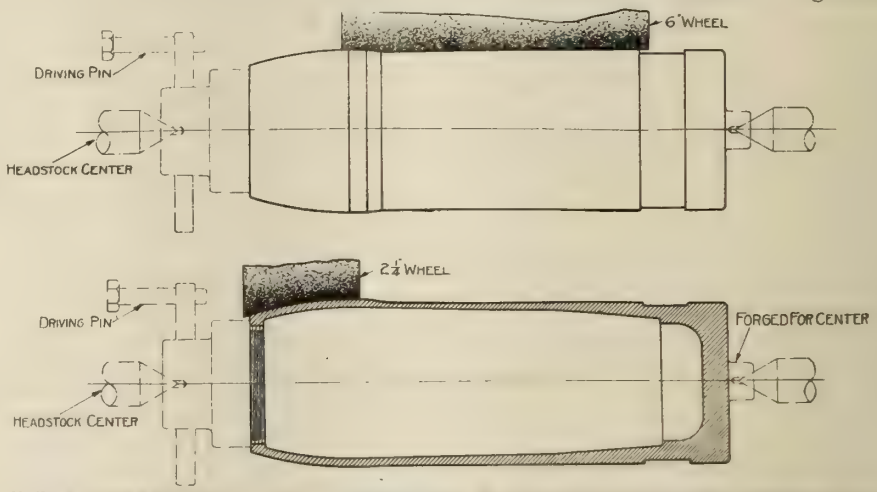

FIG. 2. OPERATIONS 1 AND 2—GRINDING 18-POUNDER SHRAPNEL SHELL ON NOSE AND BODY ONLY.

FIG. 1. SHRAPNEL SHELL BLANKS FINISHED BY GRINDING.

All in any way familiar with the production of round work would naturally assume that these shells would be roughly turned to within .030 in. of the final size whether they were to be finished by nice turning or by grinding, and the earlier estimates of lathe and grinding machine makers were based upon this common experience as well as upon the large limits shown on all drawings. As the work proceeds, however, it develops that the shells come to the grinding machines from the lathe and forming die with from .060 in. to .150 in. over size, and very eccentric, and it is remarkable with this condition that so large a production of accurate sized and formed shells can be secured by the modern method of grinding.

The illustrations show the methods followed when grinding shrapnel, and those who have adopted grinding after this fashion believe that the necessary accuracy is obtained in much less time than is possible by finish turning. Again, as experience sheds more light on the problem, the production will no doubt largely exceed the present figures by all methods.

As to machines for grinding shrapnel shells, the Norton Grinding Co. is prepared to speak with considerable authority, as it has made a thorough study of the subject and is carrying on still further investigations. The blanks shown in Fig. 1 were made for the purpose of demonstrating what could be done on their 6-in. and 10-in. machines.

Fig. 2 illustrates the British 18-pounder shell ground on the nose and body only. The diameter at the closed or headstock end of the shell is finished in the lathe.

*Sales Manager, Norton Grinding Co., Worcester, Mass

Fig. 3 shows the same shell ground on all diameters. Some manufacturers however, are producing these shells by the two-operation process, while one large American concern is finishing them by the three-operation process. The French shell with the three-operation machine, Figs. 4 and 5, was primarily designed for the Ford Motor Co. These machines are equipped with wheels 20 in. in diameter up to 7½-in. face, and are of the type sold to the E. W. Bliss Co. for grinding the body of shrapnel shells. It is not provided with power table

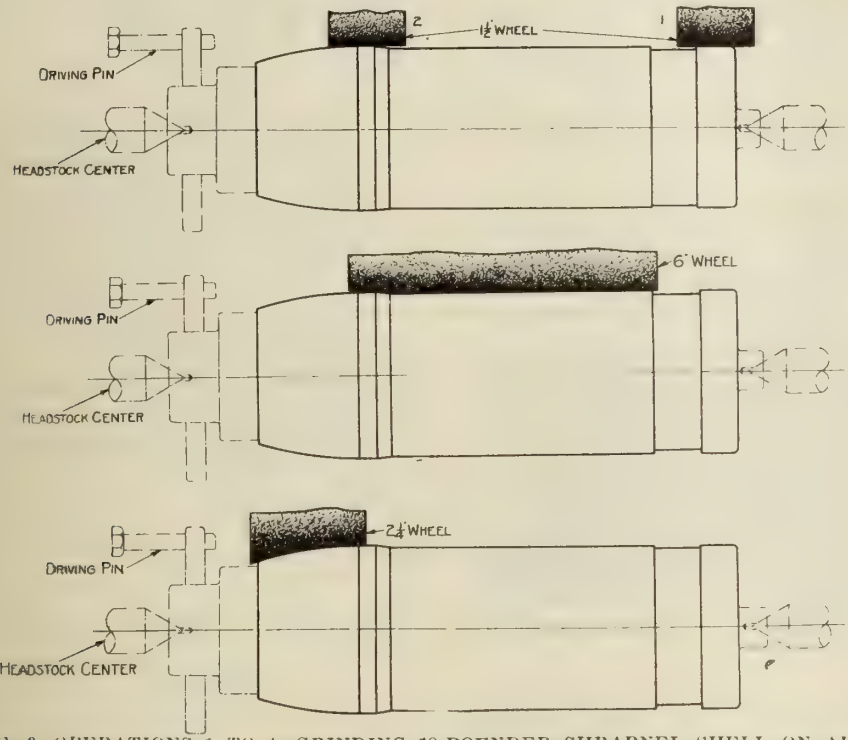

FIG. 3. OPERATIONS 1 TO 4 GRINDING 18-POUNDER SHRAPNEL SHELL ON ALL DIAMETERS.

process of grinding is dealt with practically as is the British shell, except in the matter of a few minor details.

Two qualities of finish are usually required for shells, a rough exterior body finish being demanded to take the paint application before shipment.

The 10 x 24-in. special purpose machine is primarily designed for traverse, but has a table traverse screw at the right-hand end of the base for truing the grinding wheel. The removal of a horseshoe washer from between the hub of the hand-wheel and the screw bearing permits the movement of the table a maximum distance of 3 in. by the rack and pinion at the left front of the base. The end view, Fig. 5, shows the hand-wheel for screw traverse of the table and the lever action footstock.

## TRADE RETURNS FOR FEBRUARY.

THE trade statement for February now issued by the Minister of Customs shows a grand total of Canadian trade amounting to $68,853,815, as against $61,009,141 for the corresponding month of last year.

The total trade for the fiscal year to the end of February is less than that of the corresponding period in the last fiscal year, the figures being for this year $967,632,242 and $1,019,675,054 for last year.

The imports for the eleven months, including coin and bullion, amounted to $546,506,184, as against $579,043,950 for the eleven months of 1914.

The February imports amounted to $36,201,826, compared with $38,946,771 in February, 1914.

Exports decreased during the eleven months from $404,888,632 in 1914 to $364,300,581 in 1915, exclusive of foreign goods re-exported. The February exports show a gratifying increase, the figures for the month being: domestic, $28,881,376, and foreign $3,770,613, as against $20,554,087 domestic and $1,508,283 foreign in 1914. The increases in re-exports were largely made up of coin and bullion.

Exports of domestic fisheries, forest products, animals and their products, agricultural products, manufactures, all increased in February as compared with figures for the corresponding period of the previous year, exports of domestic manufactures, nearly doubling. The figures for the latter are $8,982,639 for last February and $4,674,709 for February, 1914.

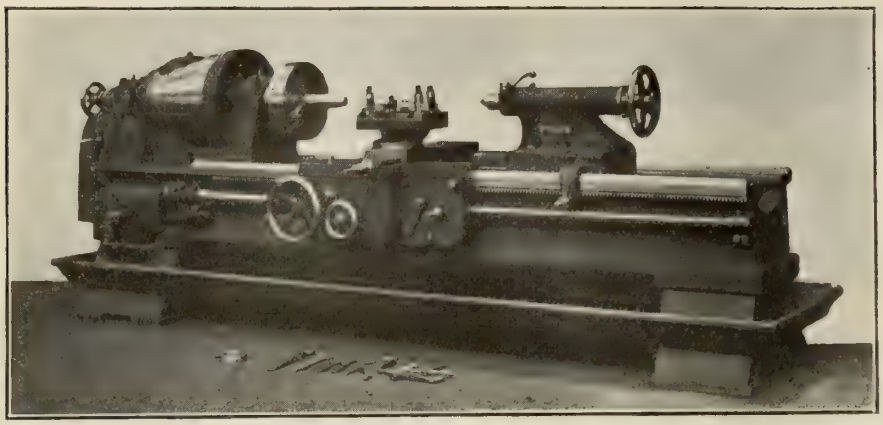
# PROGRESS IN NEW EQUIPMENT

## A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

### SHELL PRODUCTION ON STANDARD MACHINES.

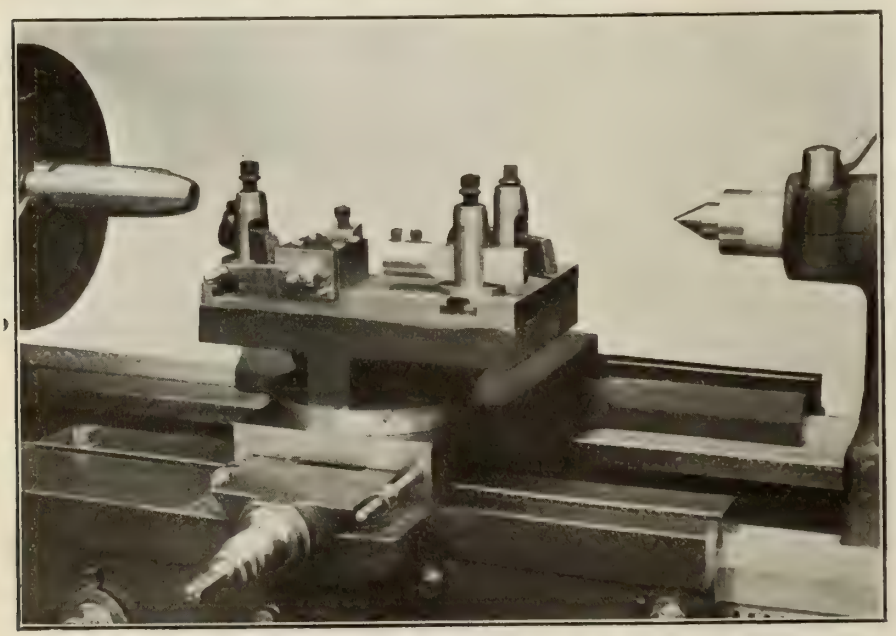
ONE problem confronting Canadian manufacturers who undertook to engage in the machining of 18 pr. shrapnel shells was that of providing suitable equipment. Some decided to install automatic and semi-automatic machines, while others decided to utilize standard lathes with special fixtures to suit the operation required. Our attention has been called to a lathe recently supplied by the John Bertram & Sons Co., of Dundas, Ont., to the Toronto Laundry Machinery Co., which shows very clearly what can be accomplished along these latter lines.



JOHN BERTRAM & SONS CO. STANDARD LATHE EQUIPPED WITH SHRAPNEL SHELL CASE MACHINING ATTACHMENT.

The machine shown is the firm's standard 26 in. double back geared quick change gear engine lathe, equipped with pan, expanding arbor, scroll chuck and four tool fixture, and the operations to be performed consist of turning the shell body to within 2 in. of open end, finishing diameter for distance of 2 in., finishing base and rounding corner.

The forged shell is cut to rough length open end and base before bringing it to this machine, a round dog held by three set screws being attached to open end. The shell is slipped over the expanding arbor, the three jaws of which centre the shell nose from the inside, the arbor being operated by handwheel shown at back end of lathe spindle. The three-jaw scroll chuck jaws engage the inside of open end of shell and the pressure of cut is taken by pin in side of dog, having a bearing against side of chuck jaw.



NEAR VIEW OF BERTRAM SHRAPNEL SHELL CASE MACHINING ATTACHMENT FOR STANDARD LATHE.

With shell in position, the machine is started and tool No. 1 used to rough turn the body to within two inches of chuck face. Tool No. 2 is then moved to position and finished diameter is turned for distance of about 1¾ in. Tool No. 3 next faces end or bottom of shell to a finish, and tool No. 4 rounds the corner completing the series of operations.

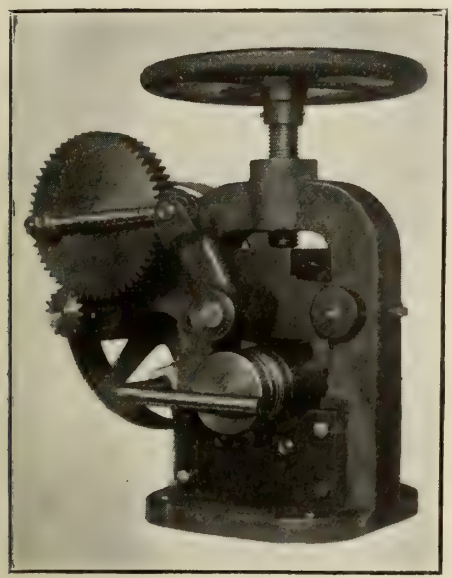
The John Bertram & Sons Co. have planned the whole series of machine operations on shrapnel shells with the most careful attention to detail, so much so that the output per each operation, compares favorably with that of machines installed for the specific purpose. One feature that appeals strongly to the average manufacturer is the fact that he requires no special operators and has an outfit of machinery suitable for ordinary machine shop requirements.

### SHELL MARKING MACHINE.

A NEW machine specially designed for marking shrapnel shells has been put on the market by the Holden-Morgan Co., Toronto, and is being used for that purpose by several shell manufacturing firms in Canada. The machine will take any size of shell up to and including an 18-pounder, any variation in the shell diameter not necessitating change or adjustment. The machine can be installed on a bench or column bracket conveniently near a shafting line. It does not need a countershaft, as it has only one speed and is continuous running when in operation. It weighs 170 lbs., and occupies a space 19 in. x 12 in. x 19 in. high.

The accompanying illustration shows clearly the general design. The main frame is an iron casting, the direct driven pulley at the back in turn driving the gear through a pinion. Inside the box shaped casting or carrier under the hand screw is the marking die which is fastened to the crank pin by a set screw and is given an oscillating motion by means of the crank and rod connection to the gear wheel. The carrier is hinged to the frame and is kept in place against the hand screw by a small spring not seen in the illustration. The crank has a travel of about 4 ins., which is reduced to approximately 1½ in. on the face of the die. The marking die is about 2⅝ in. diameter and is made of tool steel. The first four lines of markings are engraved on, after which the die is hardened. The fifth line which gives the

serial number is removable and consists of a steel ring with slots milled out at the proper distance to take the steel numbers and letters. These can be readily changed to make any series required.



SHRAPNEL SHELL CASE MARKING MACHINE.

The following shows the markings on the die, which of course are also on the shell.

**Q. F. 18 Pr.**
**III**
**F. S.**
**(MAKER'S INITIALS)**
**DATE, NO. OF MONTH, YEAR**

When in operation the shell is placed under the die and against the stop as shown. The shell rests on two hardened steel rollers and pressure is applied by means of the hand screw which forces the raised markings on the die into the shell. During this process the shell and die rotate backwards and forwards, or oscillate a sufficient distance to permit all the markings to be effective. The movement of the shell is caused by the die pressing on it. A shell can be marked in less than eight seconds, and the impression is given the proper depth without distorting the shell body. The machine is generally simple in construction and does not require a skilled operator.

## THREE NEW MACHINES FOR PROJECTILE WORK.

IN addition to its already extensive line of machinery for the manufacture of guns, projectiles and small arms, the Niles-Bement-Pond Co., New York, has recently brought out a number of new machines which are especially designed for maximum output on this class of work. Three of these machines are illustrated and described herewith, while several more are at present under construction in its various shops.

### Hydraulic Projectile Press.

Fig. 1 shows a new design 225-ton hydraulic press, especially adapted for projectile work. It can also be furnished in sizes varying from 50 to 1,000 tons. The press is of the four post, inverted cylinder type, with the cylinder in the cap or upper platen and the piston attached to the middle platen. The lower platen is stationary, the work being done by the downward stroke of the middle or movable platen. The platens are of heavy box section, being 54 in. square. The tension bolts form a guide for the moveable platen. These bolts are of high grade forged steel 5½ in. in diameter, and there is 37 in. x 37 in. clear distance between them.

The main cylinder is supported by the upper platen and is a separate casting. Its plunger is 21⅝ in. in diameter and is hemp packed. At 1,500 lbs. water pressure per square inch, the plunger exerts a downward pressure of 275 tons. The stroke of the main plunger is 36 in. The drawback cylinder is set in the main plunger, its packing being at the top and accessible. This plunger bears upon a yoke, which is tied to the movable platen by bolts. The drawback plunger exerts a lifting pressure of 50 tons, and is directly above and in line with the main plunger centre. The maximum distance from the top surface of the lower to the under surface of the working platen is 76 in. The cylinders are steel. The plunger in the main cylinder is also of steel. The glands are of outside construction for hemp and are easily accessible. The main cylinder is bronze bushed where it is subjected to contact with the steel plunger.

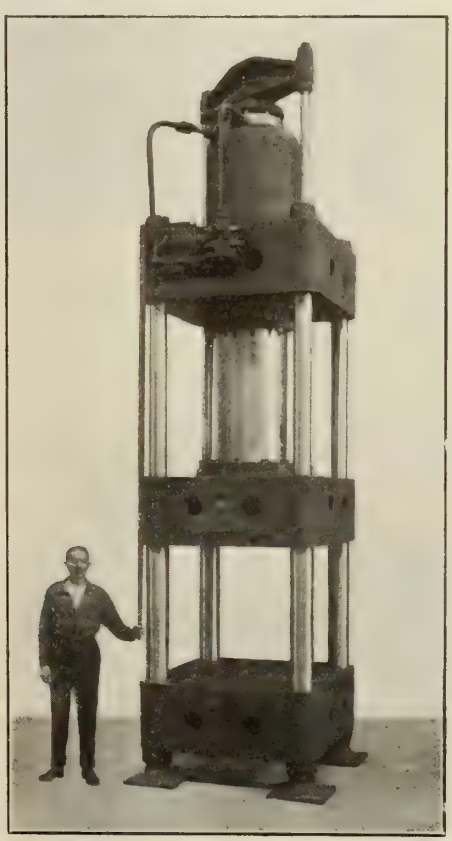


FIG. 1. HYDRAULIC PROJECTILE PRESS.

The press is equipped with an operating valve of the poppet type. It is of hydraulic bronze, with renewable seats, and is operated by hand lever placed in a convenient position for the purpose.

### Heavy Duty Projectile Turning Lathes.

Fig. 2 shows a new type of lathe for high production turning on projectiles up to 8 or 10 inches. It is designed for rough and finish turning and is built in two sizes, 20 in. and 24 in. This lathe is of the most solid and substantial construction, with large wearing surfaces, and at the same time is easily and quickly handled in all movable parts. All material entering into the lathe is the best obtainable for the purpose, main and high speed bearings are bushed with high grade bronze, driving and feed gears and feed racks are of forged or cast steel accurately cut, and all shafts, feed screws and bolts are of steel. The bed is wide and deep, with box girder cross ties at frequent intervals, and is provided with flat tracks. The bed is mounted on legs, allowing chips to be readily cleared out, and also giving spindle centre height of 42 in. above floor, which brings the work at a very convenient height for the operator. A rack is cast in the bed near the centre between the tracks, to receive the tail brace pawl.

The headstock is of heavy design, having an especially long bearing on the bed. The face plate is driven by a direct connected 15-h.p. motor of 2 to 1 speed variation. There are four mechanical changes of speed by two levers conveniently located on front of headstock. The speed levers are interlocked so that two speeds cannot be engaged at the same time. The gearing in conjunction with the speed changes by the controller give 60 face plate speeds, varying from 12 to 350 r.p.m. The motor is started, stopped and reversed by a drum type switch, mounted at the head end of bed. Dynamic brake is provided for instantly stopping work. The pinion driving the main face plate gear is so mounted in the headstock as to eliminate any tendency of the resistance of the cut or of the power applied to this pinion to lift the main spindle in its bearings; also the main spindle caps are relieved of the upward thrust due to the cut.

The face plate is removable permitting the rapid interchange of face plate and chuck. All bearings in the headstock are bronze lined, the shafts and spindles being accurately ground to size. All the bearings and gears in headstock are en-

tirely enclosed and oiled continuously from a tank in the head, which is kept filled by a geared pump drawing oil from a tank under the head, into which all surplus oil drains and is filtered before use again. Oil supply pipe visible feed and tank is provided with a gauge showing oil level. The main spindle thrust bearing is self-oiling and of ample diameter.

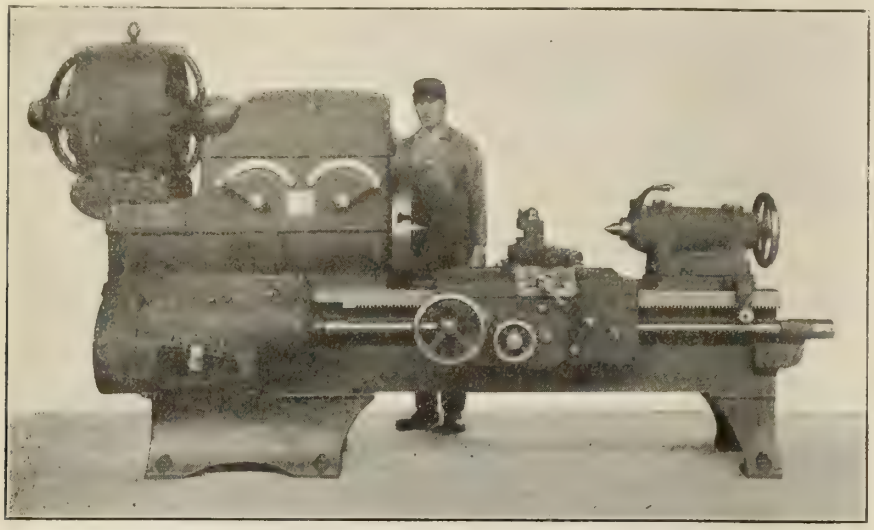

FIG. 2. HEAVY DUTY PROJECTILE TURNING LATHE.

The carriage is fitted with flat tracks bearing the entire width, making a very short span for the bridge of carriage. The carriage is gibbed to the bed underneath the tracks both front and back. Wipers are provided at each end to keep the bearing surfaces clean. The tool rest is of the compound swiveling type, travels in a wide bridge and is of such length that the bearing surface is not uncovered when turning largest diameters. The tool has both hand and power longitudinal and cross feed in either direction. The upper slide has a swiveling tool holder open on one side and of ample strength for holding tools 1¾ in. x ⅞ in. The lower tool slide, swivel and upper slide are steel castings.

The apron is of substantial, ribbed box construction, supporting the feed gear shafts at each end. All rotating bearings are bronze lined, with ample provision for lubricating all from one point. The friction for engaging the power feed is of large diameter, giving operator complete control under all conditions. A wide range of feeds is provided, and the changes are by a quick-change gear mechanism operated by one handle. A screw cutting mechanism can be furnished when desired.

The tailstock is of very large box section, which is considerably increased toward the end carrying the centre. The tailstock can be securely fastened in any position on the bed, by means of four large bolts, running to the top and heavy clamps. In addition to this, a tail brace engaging a rack in the bed is provided which prevents absolutely the tailstock from slipping under heavy end thrusts. The spindle is of forged steel of large diameter, and a graduated set over for small tapers is provided.

| Principal Dimensions. | 20 in. | 24 in. |
|---|---|---|
| Length of bed ..... | 8 ft. | 8 ft. |
| Takes between centres | 2 ft. | 2 ft. |
| Swing over bed ..... | 21 in. | 25 in. |

**Heavy Projectile Boring Lathe.**

Fig. 3 shows a 36 in. massive powerful lathe for rough and finish boring of projectles from 6 in. to 14 in. diameter. Although it is of the heaviest and most substantial design throughout this lathe can be handled with ease and facility. All of the driving and feed gears and feed rack are forged or of cast steel; all shafts, feed screws and bolts are of steel, while all main and high speed bearings are bushed with high grade bronze. The bed has flat tracks and is of large cross section, with box girder cross ties at frequent intervals. A rack is cast in the centre between the tracks for the tail brace pawl.

FIG. 3. HEAVY PROJECTILE BORING LATHE—FRONT VIEW.

The headstock is of especially massive box construction. It is extremely long, being 7 ft. 5 in. on the bed, furnishing a most rigid support for the spindle, gearing and motor. A further idea of the enormous proportions of the head can be gained from the size of the front spindle bearing which is 8 in. in diameter and 23 in. long. All of the bearings and gears are entirely enclosed, and oiled

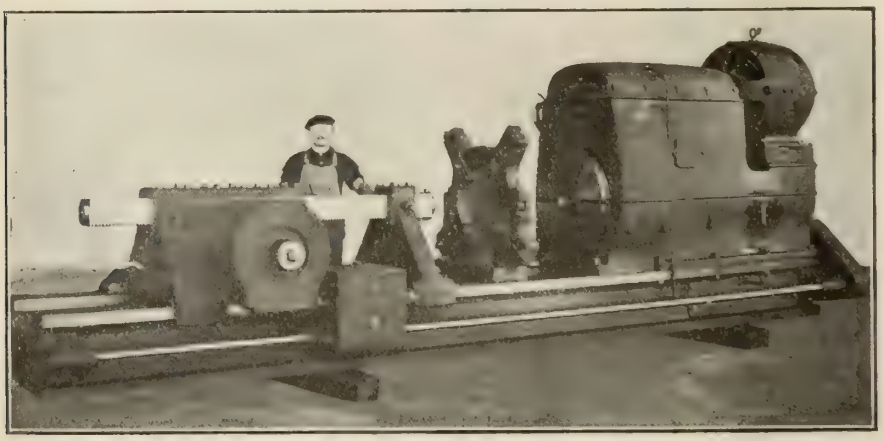

FIG. 3. HEAVY PROJECTILE BORING LATHE—REAR VIEW.

continuously from a tank in the head which is kept filled by a pump drawing oil from a tank in the bed. The main spindle is driven by a 35-h.p. direct connected, variable speed motor mounted on the headstock, through gearing which gives three mechanical changes of speed controlled by convenient handwheels. The gearing in conjunction with the speed variation of the motor by the controller gives 60 face plate speeds varying from 2½ to 77 r.p.m. By means of a handle adjustably mounted on the bed, the face plate may be started, stopped, reversed, or any of the different motor speeds obtained, without requiring the operator to leave his position at the boring tool.

The low speeds of the face plate are obtained by a pinion driving the face plate gear and so mounted in the headstock as to eliminate any tendency to lift the main spindle in its bearings and also relieving the main spindle caps of the upward thrust due to the cut. The higher speeds are obtained by driving through the face plate spindle, thus obviating the necessity of running the face plate pinion at an excessively high speed. The main spindle thrust bearing is of the roller type, self-oiling and of large diameter.

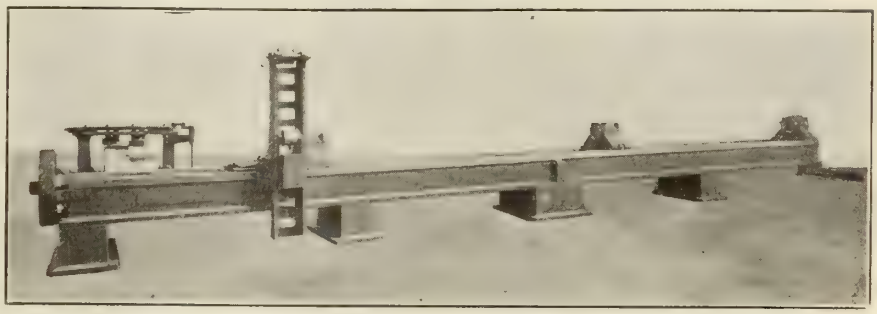
The boring tailstock is fitted with a square boring ram of forged steel, and of large cross section. The feed for the ram is from a shaft running from the head along the back side of the bed. The feed is through rack, gear, pinion and worm gear to give smooth motion. The feed is started and stopped and reversed by large hand spiders. Eight feeds are provided, varying from .005 in. to .030 in. per revolution of the face plate. Four of these feeds are operated by a positive clutch mechanism without change of gears, the changes being made by two levers on the front side of the tailstock, and traveling with it. The remaining four feeds are obtained by one change of gears at the head end. The boring bar has a continuous feed of not less than 48 in. without resetting of the tailstock.

The tailstock is long and of large cross section, affording rigid support for the boring ram. The tailstock can be securely fastened in any position on the bed by large bolts and heavy clamps. In addition, the tailstock is fitted with a tail brace engaging the rack in the bed which prevents slipping under heavy end thrusts. A support which slides with it on the bed, is provided for the boring ram. This supports the ram near the end carrying the tools and tends to prevent vibration. The steady rest is designed to take from 6 in. to 20 in. in diameter. It is of stiff box section, with four jaws of large cross section.

## GUN RIFLING MACHINES.

THIS machine is in two parts, consisting of a bed with two reversible steady rests to support the gun, and a runway mounted on legs which carries the traveling carriages and bearings for supporting the rifling bar. The bar is held longitudinally in the carriage bearing seen in the photograph near the left hand end of the runway but is free to turn therein, and is provided with a spiral groove of the same pitch as the rifling in the gun. The index head at the extreme right has a pin which engages in the master groove of the bar, thus imparting its rotary motion in combination with the longitudinal movement derived from the traveling carriage. A twisting tension is kept on the bar by the counterweight mechanism on the carriage which obviates the danger of lost motion due to the wear of the pin which engages in the master groove. The intermediate bearing provides an additional support for the bar, and is so geared as to travel at exactly one half the speed of the carriage, thus remaining always equidistant between the carriage and the index head and reaching the end of the runway simultaneously with the carriage. The index head provided a means of setting the bar for a given number of grooves. The carriage and half speed bearing drive their motor from a quick pitch screw 4¾ in. in diameter with a shifting belt drive as in the photograph or by a direct connected reversing motor such as is used on planer drives.

The machine will rifle guns up to 8 ins. bore, any length desired, and is provided with a powerful oil pump driven by a 3 h. p. motor, and with a telescoping oil pipe. For rifling guns 8 ins. bore by 30 ft. long, the machine weighs about 50,000 lbs., and requires a 10 h. p. drive. The driving gears are completely covered, and cutting and return speeds of any reasonable amount can be arranged.



GUN RIFLING MACHINE FOR BETHLEHEM STEEL CO.

Detrick and Harvey, Baltimore, Md. are the designers and manufacturers of this product.

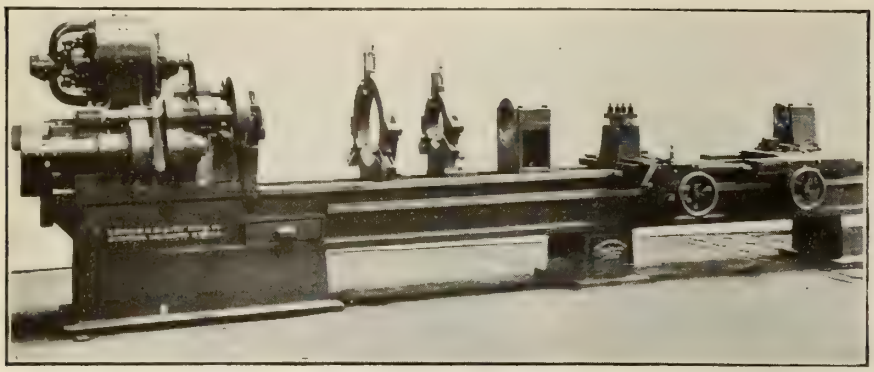
## GUN BORING LATHES.

THIS lathe built by the Detrick & Harvey Co., Baltimore, Md. is equipped with an all-geared motor driven headstock, the motor being attached directly to same, and having a solid forged steel spindle 5¾ ins. in diameter running in bronze bushed bearings each 12 ins. long. The spindle thrust is taken by a roller bearing 8 ins. in diameter, thus eliminating excessive friction at this point. A 3 to 1 variable speed motor is used, which with four gear changes gives speeds ranging from 2 to 111 r.p.m. Ten reversible all gear feeds from .002 to .020 are obtained through change gears, and by shifting a clutch these may be increased to from .030 to .333, making twenty changes in all. The spindle is provided with a threaded nose to receive chucks. All driving gears and pinions are of steel or bronze and all driving shafts run in bronze bushed bearings. The boring carriage has a bearing which will accommodate bars up to 4¾ ins. in diameter.

This lathe is not designed for turning, but an extra carriage is provided having a plain tool rest with hand cross

SECTION OF BED FOR GUN RIFLING MACHINE.

feed for cutting off or trimming up the work. Both carriages are fitted to the ways by square locks and have steel taper gibs for taking up wear, power



GUN BORING LATHE.

longitudinal feed which may be disengaged at will, and the usual rack and pinion hand traverse. To avoid unequal pull on the carriage, the lead screw is placed between the ways directly under the bar. It is 3 ins. in diameter and is held in tension between capped bearings in the bed with ball thrust bearings. Two steady rests are provided, one taking from 3 ins. to 10 ins. in diameter, and the other from 6 ins. to 18 ins. Bearings to support the boring bar are also furnished. The machine swings 27 ins. over the ways and is designed for boring guns up to 6 ins. calibre of any length.

An oil pump of unusually large capacity is used and is driven by an independent motor. The large leg under the bed at the headstock serves as an oil reservoir and is fitted with a strainer and removable chip pan. The bottom of the bed is given an inclination towards this reservoir in order to retain the waste oil. Oil is delivered from the pumps by means of a telescoping tube to the cutter. All gears are covered. A 10 h. p., 3 to 1 variable speed motor is required for the drive and a 3 h .p. motor for the oil pumps. The machine with 30 ft. bed weighs about 24,000 lbs.

## LATHE TURRETS FOR SHELL MANUFACTURE.

MODERN methods of manufacturing to obtain the most economical production, demand carefully designed special tools and fixtures, capable of performing duplicate operations accurately and to the best possible advantage. Automatic turrets for carrying these special tools have rapidly come into general use, the large expense necessary to install specially designed turret lathes being oftentimes not warranted by the amount and nature of the work to be performed. The accompanying illustrations show two designs of lathe carriage turrets, known as styles B and G, and manufactured by Fay & Scott, of Dexter, Maine.

These turrets are designed to go on the lathe carriage in place of the regular tool block, and are made for carrying ordinary lathe tools, or tools with round shanks. All styles have a patented revolving and locking mechanism, which, by a single movement of the lever handle, forward and back, releases the turret, turns the next tool into position and locks the turret. This is a quite valuable feature, inasmuch as it requires the use of but one hand of the operator.

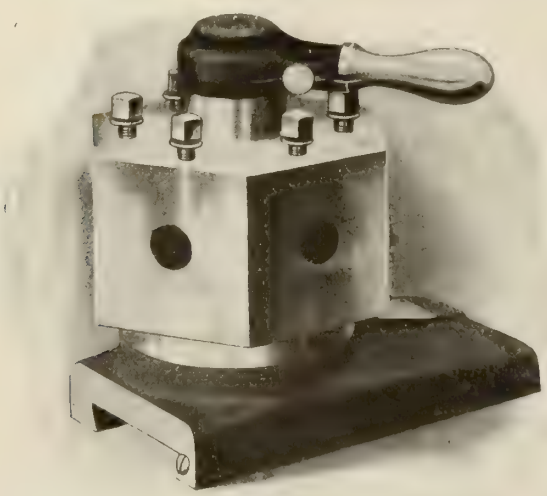
The turret base is fitted with taper gib adjustable for wear, and the locking pin is also fitted with an adjustable taper gib. The locking pin and ring are made of tool steel, hardened and ground to reduce the wear on these parts to a minimum.

The turrets are guaranteed to index accurately, to within a fraction of a thousandth, and each tool has provision for adjustment, by means of a segment, or rocker chip, same as used in the regulation tool post. Two binder screws serve to hold each tool securely. By the use of turret equipment attachment, a valuable addition is made to the regular capacity of an engine lathe, while many of the advantages of a first-class turret lathe, with the exception, perhaps, of a few automatic features, are available.

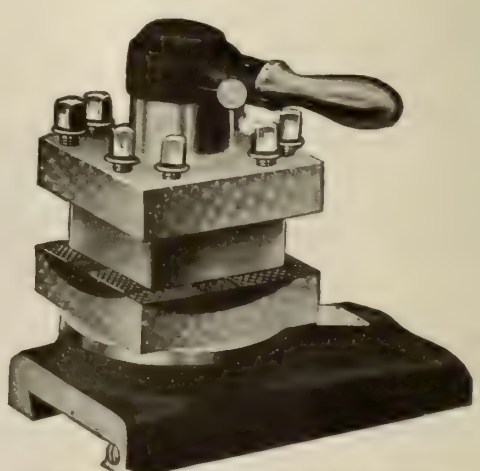
Style B turret has a hexagon head, and the faces can be drilled to jig for bolting on special tools or fixtures.

Style G is in the nature of a four-sided tool post, carries ordinary lathe tools, and is very suitable for general work, such as turning, boring, threading, etc. It can also be used for carrying special forming tools and performing the same functions as the ordinary tool post. Its advantage is in having four tools always in position to be brought quickly into successive operation.

Since the manufacture of shrapnel shells became so prominent a feature of the output of our Canadian engineering shops, we understand many large orders, including repeat orders for these turrets, particularly style G, have been received and filled by Fay & Scott.



STYLE B LATHE CARRIAGE TURRET.

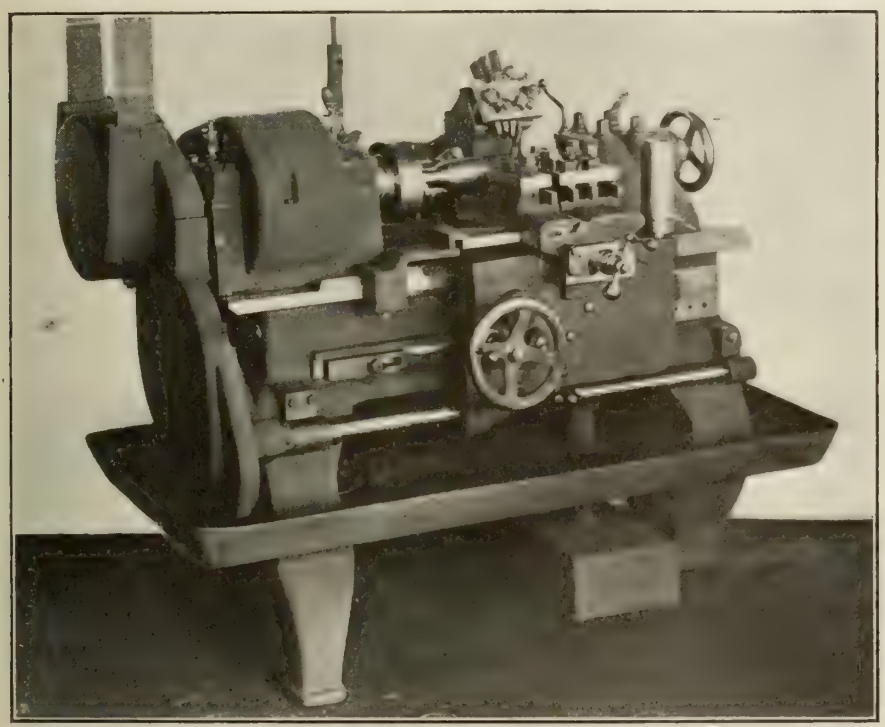


STYLE G LATHE CARRIAGE TURRET.

## 14-IN. HEAVY AUTOMATIC SHRAPNEL LATHE.

THE illustration and description refer to a recent product of the Reed-Prentice Co., Worcester, Mass., which is known as their heavy automatic shrapnel lathe. It is here shown tooled-up for machining British 18-pounder shrapnel shells, roughing and finishing, in the latter of which it performs the interesting operation of radius turning in forming the shell nose.

Previous to the roughing operation, the shell is centered on its closed end in a sensitive drilling machine specially equipped for the purpose with a centering device. The forging has also been cut to length. In the heavy automatic, the rough piece is held by the internal



14-INCH HEAVY AUTOMATIC SHRAPNEL LATHE.

expanding jaws of a chuck at the open end and by the tail centre. The front tool block supports four cutting tools, which are fed into the work to the required diameter by a cam feeding-in element that controls the automatic cross slide with the travel of the carriage. An actual travel of about 2 in. is required to rough turn the full length.

While the front tools are performing the diametral work, the back arm is brought forward with its three or four tools—according to the design of the shell as adopted by the individual Government—and forms the groove for the copper rifling band, squares down the closed end, rounds the corner and in some cases forms the small groove to receive the brass powder case, which is spun upon it. The back arm is operated by the longitudinal travel of the carriage which carries a cam that determines the feed of the back arm tools. The time required for these operations is 4 min.

The shell next goes to a turret lathe to have the diaphragm seat and powder chamber bored out, and the open end rough turned and rough squared. Another machine undercuts the groove for the copper band, and waves or knurls its bottom, to prevent the band from slipping. The shell is then heat-treated and the open end again heated in a lead bath and closed in, to form a portion of the nose.

The next process is the boring out and reaming, squaring down the open end and threading it to receive the fuse plug, which operations are performed in a turret lathe. The shell is copper banded and is then ready to go to the heavy automatic for the finishing operation. A threaded plug with driver is screwed into the open end, and the shell is placed between centres, to be given a finishing cut all over, including the radius turning of the nose. The front tool block is constructed specially for this operation. A wide bottom block, operated by the cam feeding-in attachment, carries two tool blocks, one of which is securely fastened to the bottom block and has two or three tools, as required, for the straight turning of the shell body.

The second block is mounted on a dovetail of the bottom block and is actuated by a cam surface which is held stationary in relation to the bed, so that the longitudinal movement of the carriage will force the auxiliary holder into the work in whatever form the cam surface may prescribe. The form in question is that of the radius of the nose. The back tool block carries a forming tool, the shape of which is governed by that of the copper band. This is not shown in the cut.

The time required for the finishing processes is also 4 min., so that the two machines together perform their work at the rate of 15 shrapnel an hour or 135 in a 10-hr. day, allowing the usual reduction of 10 per cent. for lost time.

## SHELL MANUFACTURE AT HAMILTON, ONT.

ANNOUNCEMENT was made on March 13 that Hamilton manufacturing concerns had secured orders for shells and parts of shells that totalled over $2,000,000 in value. The following firms got orders to the value of shells or parts of shells opposite their names:

Brown, Boggs Co., $15,000; Canadian Westinghouse, $75,000; Dominion Steel Foundries, $50,000; National Machine Co., $15,000; Petrie Mfg. Co., $15,000; Sawyer-Massey Co., $20,000; Smart-Turner Co., $10,000; Steel Company of Canada, $65,000; Chadwick Bros., $400,000; Canada Steel Goods Co., $200,000.

**Cartridge Clips.**

Chadwick Bros., $100,000; National Steel Car Co., $100,000; Steel Company of Canada, $520,000; Canadian Westinghouse Co., $25,000; Dominion Steel Foundries, $60,000; Hamilton Brass Co., $125,000; Tallman Brass Co., $100,000; Schultz-Meng Co., $200,000; National Machine Co., $200,000.

**Plugs and Sockets.**

Canadian Westinghouse Co., $150,000; Chadwick Bros., $40,000; Hamilton Brass Co., $50,000; Tallman Brass Co., $75,000.

**Tubes.**

Hamilton Brass Co., $50,000.

## RECENT BRITISH NAVY ADDITONS.

THE Navy List for January reveals the fact that several vessels have been put into commission since the last list was issued in December. Two light cruisers have been added, these being the Cordelia and the Caroline, the latter being the boat which was built in record time.

These boats have a displacement of about 3,800 tons, and the designed speed is 30 knots, although this can probably be exceeded when required. The machinery installation gives a total indicated horse-power of 40,000, and the boilers are fired by oil fuel only, about 750 tons being carried. Turbine machinery is, of course, installed, and the armament consists of two 6-in. and six 4-in. guns, both being of 50 calibres. There are four 21-in. torpedo tubes above water, one pair on each side.

Six more boats of this class have yet to be put into commission, three of which

are listed as building and three as completing. All these vessels are of the 1913 estimates, but there are still four light cruisers of the 1912 estimates to be finished. One of these was completed and commissioned on the 10th December last, this being Penelope, a sister ship to the Arethusa. The Penelope is of very much the same size as the Caroline class, the displacement being 3,600 tons and the draught about 14 feet. The armament is the same, and the power installation is between 36,000 and 37,000 i.h.p., giving the same speed of about 30 knots. All these boats have a 3-in. armoured belt.

Among the destroyers commissioned since the last month's issue of the Navy List are the Matchless, the Mentor, Milne, Morris, and the Murray. These boats probably have a speed of about 35 knots.

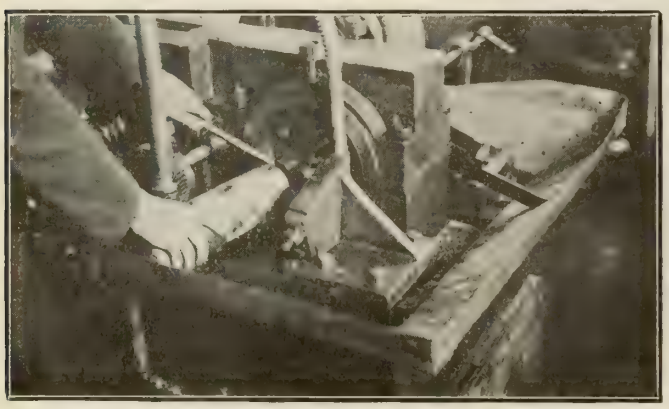
## CUTTING-OFF AND FACING MACHINE.

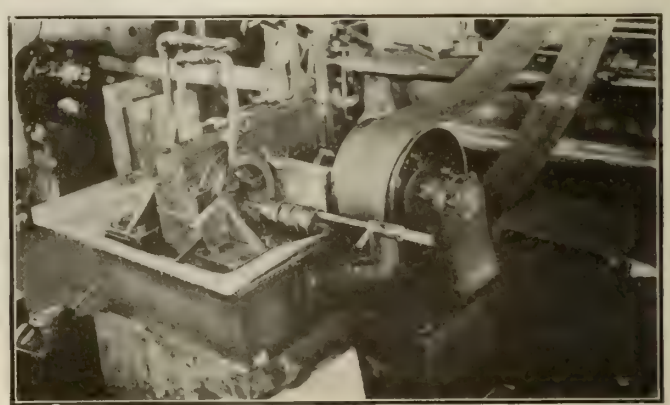
THE accompanying illustrations show the cutting-off and facing machine for shrapnel shell forgings which is manufactured by the Hamilton Gear and Machine Co., Toronto. This machine cuts off the excess length at the mouth, and rough faces the base of the shell at one operation, the two tools working simultaneously on the two ends of the forging, which is held and driven at the middle. With a surface speed of 80 feet per minute, the actual cutting time is 40 seconds. The additional time for returning the tools to the starting position and changing work bring this up to about one minute or a minute and a quarter, according to the activity of the operator. On an all-day run, an additional quarter or half minute should be allowed for tool changing and other delays.

The shell is located from a stop against the inside of the base, thus ensuring standard thickness of the latter. The forging is gripped in an automatic chuck by six spiral cam jaws, which hold more tightly, as greater force is applied by the cut. The curve of the jaws is so chosen that, while the gripping power is very great, there is no tendency to jam, and the chuck opens easily after the heaviest cuts. These jaws are of tool steel and work in tool steel bearings, while an internal ring gear compels the jaws to act concentrically. A tight-fitting cast iron bushing keeps chips and dirt out of the mechanism.

The drive is by an 8-inch belt through a Dodge friction clutch, and all the spur gears, both on the drive and feed, are steel, except the large chuck gear, which is cut from the solid chuck body. The moving gears for changing the feed to quick return are of heat-treated chrome nickel steel. The feed worms are steel and the worm wheels phosphor-bronze. All the bearings are high-grade Babbitt except the slow-running bearing of the revolving head.

The machine automatically stops at the end of the tool travel, and a quick return is provided of four times the cutting speed. A gear pump supplies a three-quarter inch stream of cooling liquid for each tool from a large reservoir in the base. The cooling system is claimed to be so effective that the tools do not suffer from heat at all, but only wear out from actual rubbing of the chips. The tool-holders are of heavy duty design and of such shape that they will take long lengths of high-speed steel bar without forging, thus eliminating waste in short ends. All gears are completely enclosed, the main gear dipping into an oil bath. Gauges are supplied for grinding and setting the tools. The machine can be arranged for motor drive if desired, and can also be supplied in a 5-inch size for cutting up billets for 4½-in. howitzer shells.





CUTTING-OFF AND FACING MACHINE FOR SHRAPNEL SHELL FORGINGS.

## TRANSPORTING BRITISH REINFORCEMENTS.

FRESH British troops, sent as reinforcements to the army of the allies, are being more or less continuously landed in France, and this is done in an altogether admirable way. The great transport ships enter various French ports while the North Sea and the channel are protected by torpedo boats, destroyers, and a few swift cruisers. The transport ships follow each other at short intervals. A calm, cheerful mood prevails on board, when the soldiers enjoy the freedom which is always their privilege in leisure hours.

Hardly, however, has the French coast been sighted than everything is arranged with the utmost speed for the landing. As a ship swings into its place the soldiers stand ready to march. The wagons of the division are ready loaded. Ample space has been reserved on the quays for the landing, but no more are landed than the railways can carry at a time.

As soon as a ship is empty she moves on at once to another point in the harbor, and is followed by a new transport, with almost clock-work regularity. The efficiency of the organization is well illustrated by the fact that in one French harbor no less than 28 transports discharged within 24 hours.

**Shell Manufacture**—According to a return presented to the House of Commons recently, over 200 factories from Cape Breton to Winnipeg are engaged in the manufacture of shells. The steel being used is all Canadian and is being supplied by the Nova Scotia Steel & Coal Co. of New Glasgow; Dominion Iron & Steel Co., Sydney; Steel Co. of Canada, Hamilton; Algoma Steel Co., of Sault Ste. Marie; the Electric Steel Co. of Welland, and the Canadian Steel Foundries in Montreal. Until the outbreak of this war, with the exception of the Dominion Arsenal in Quebec, not one factory in Canada had ever made a shell. Already the contracts for shells are reckoned to amount to $80,000,000.

Of Canada's 1914 output, Ontario produced the largest quantity of pig iron, namely, 556,112 tons. Nova Scotia made 227,052 tons.

# Finishing Shell Parts on Automatic Chucking Machines

By C. T. R.

*Of no less importance, either in the matter of accuracy or that of profitable output with respect to the shell body finish are those of the various accessory parts which go to make up the complete shell unit. That quality and quantity production can be profitably realized is made evident by a study of the detail operations featured in this article.*

BEFORE detailing the various operations involved in the production of the shrapnel shell parts illustrated in Fig. 1, a more or less brief description of the particular type machines on which the work is performed will be first in order.

The machines are a product of the New Britain Machine Co., New Britain, Conn., and are built in two distinct automatic multiple spindle types, single head

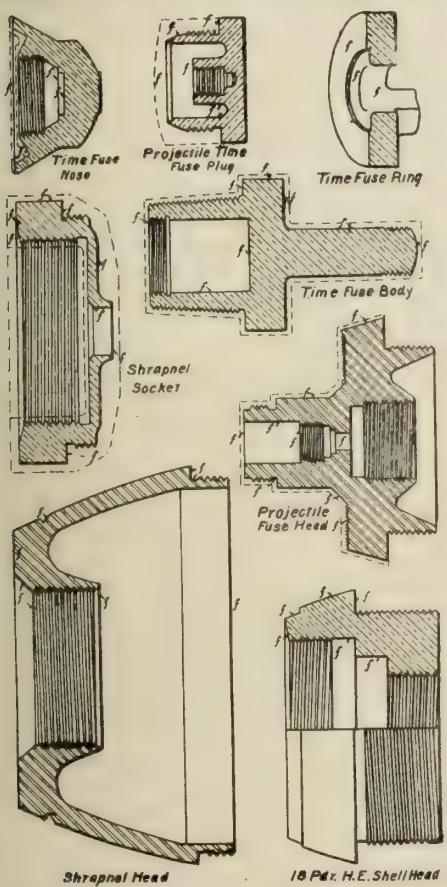


FIG. 1. DETAIL OF SHELL PARTS FOR MACHINING.

and double head. The former are designed for machining pieces which require operations on but one end, or on pieces where one end has already been machined. The double head type handles pieces requiring operations on both ends, accomplishing the result in one half the time which would be required if each end were finished separately in a single head machine.

As their name implies, the machines have several spindles, ranging from four in the small single head machines, to eight in the large double head. The spindles carry and revolve the tools, while several pieces of work are held stationary in the multiple chuck turret, which, when it indexes, brings each piece of work in line with the next succeeding spindle. All machining operations take place in the intervals marked by the automatic progression of the turret indexing mechanism, the time necessary to complete a piece being measured by the period required for the longest single operation on it.

In the case of the single head machine the turret advances and feeds the pieces of work against the revolving tools, while in the double head the revolving tools advance from both sides and form their operations on each end of the work.

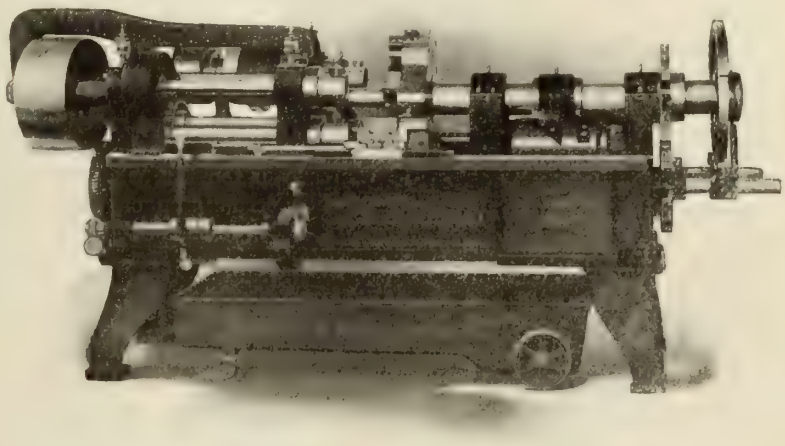

FIG. 2. AUTOMATIC MACHINE, OF SINGLE HEAD TYPE, WITH FOUR WORKING SPINDLES AND FIVE CHUCKING POSITIONS.

In this way a series of operations are carried out on several pieces of work simultaneously, the pieces approaching completion as they progress from one tool to another.

The centres of the work-holding sec-

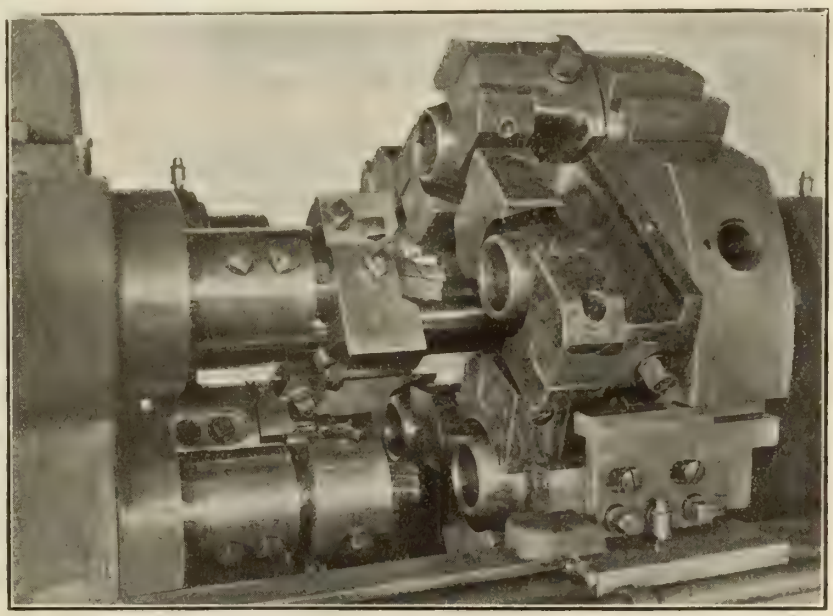

FIG. 3. VIEW OF CHUCK JAWS FOR SHRAPNEL SHELL HEADS.

tions of the turret are arranged in a true polygon. The tool spindle centres are directly opposite and aligned with all but one of the turret section centres

on the point of the polygon. As the turret indexes, it brings the chuck section opposite where there is no tool, in the most accessible point to the operator for unloading and loading.

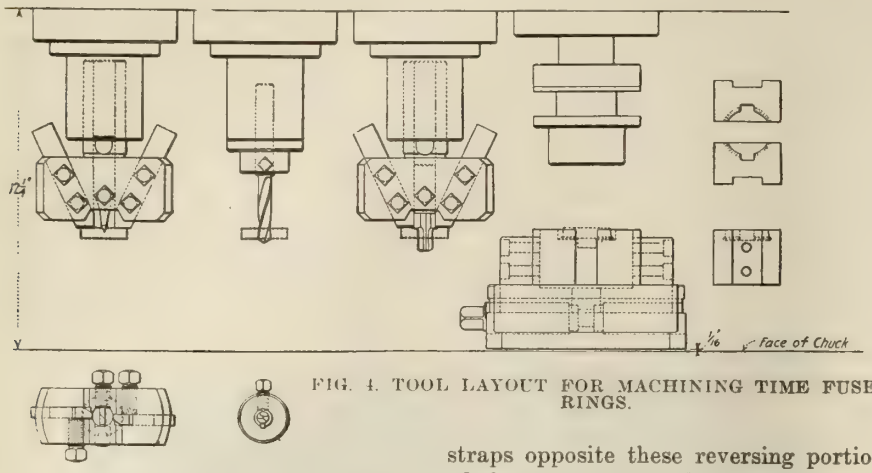

FIG. 4. TOOL LAYOUT FOR MACHINING TIME FUSE RINGS.

### Single Head Machine.

In the single head machine, the work-holding multiple chuck turret has its chucking sections in line with and facing the tool carrying spindles. The turret is mounted on one end of a rigid turret barrel, which will both turn and slide in two large bushed bearings. On the opposite end of the barrel is the indexing mechanism which automatically locates the turret in its different indexed positions.

Directly below the turret barrel and between its two supporting bearings is a large drum mounted on a shaft, which is revolved by a worm gear at the extreme left of the machine. Cam straps are bolted to the outside of this drum and act directly against a hardened tool steel roller on the turret yoke, which may be clamped in any position on the barrel. This yoke adapts the machine for handling different lengths of work, and in most cases avoids the necessity of any change in cam position or overhang of tools. The angle of the cam straps depends upon the length of feed required on the piece being machined, and the balance of the path of the cam changes rapidly to quickly throw the turret forward and back to clear the tools at the time of indexing. Guard straps opposite these reversing portions of the cam prevent the turret from being thrown too far, while an adjustable positive screw stop on the side of the turret yoke accurately gauges the forward movement of the turret.

All turrets have one more chucking section than there are tool spindles. This section is used for loading and unloading without loss of time while the machining operations are being carried on simultaneously in all the other turret positions. Each pair of chuck jaws is independent of the others, and is quickly operated by a right and left-hand screw, which has a square end extending for a chuck wrench. The chuck, when equipped with proper shaped jaws, will accurately centre and adequately grip the work. The screws and chuck jaws are made from crucible tool steel hardened.

### Double Head Machine.

Corresponding sets of tool-carrying spindles are mounted on the bed of the machine at either end. The multiple chuck turret is midway between the two shafts, having the indexing mechanism at the extreme right. All sets of chuck jaws are in line with the spindles, and are designed to hold the work centrally in order that machining operations may be carried out on both ends of a piece at the same time.

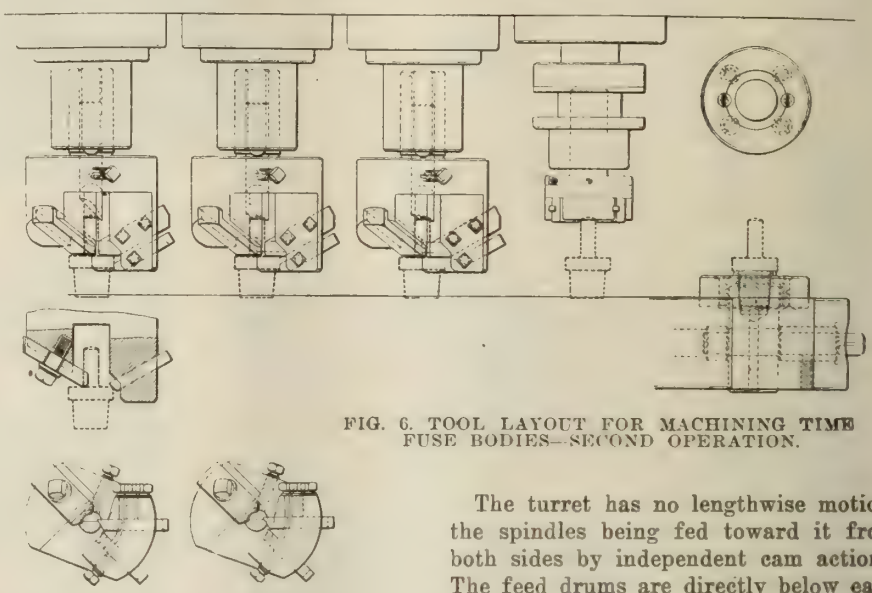

FIG. 6. TOOL LAYOUT FOR MACHINING TIME FUSE BODIES—SECOND OPERATION.

The turret has no lengthwise motion, the spindles being fed toward it from both sides by independent cam actions. The feed drums are directly below each group of spindles, and are mounted on a shaft driven by a worm gear at the extreme left of the machine. Cam straps to control the movement of the spindles in accordance with the requirements of the work, are bolted on the outside of these drums and act directly against hardened tool steel rollers on the spindle yokes.

Each group of spindles, being independent, may be cammed and tooled for like or unlike operations, depending upon the design of the piece being machined. The angle of the cams varies according to the length to be machined. The balance of the path of the cams changes rapidly to quickly withdraw the tools to clear the work each time the turret indexes. Guard cams prevent the spindles from being thrown too far back, and positive screw stops are provided on the yokes to accurately control their forward movement. The opposite spindles being in alignment make it possible to

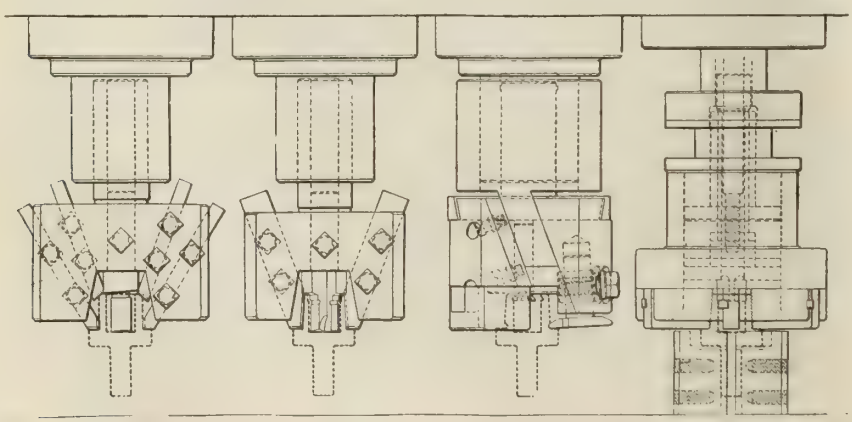

FIG. 5. TOOL LAYOUT FOR MACHINING TIME FUSE BODIES—FIRST OPERATION.

finish pieces of work on both ends concentrically.

A steady rest of the sliding key design automatically locks the turret to the bed of the machine while the tools are in operation. This feature adds greatly to the life and accuracy of the machine, as the turret barrel and indexing mechanism are relieved of all strain during machining operations. Independent devices are provided for taking up wear in both directions. Steady rests are fitted to both single and double head machines.

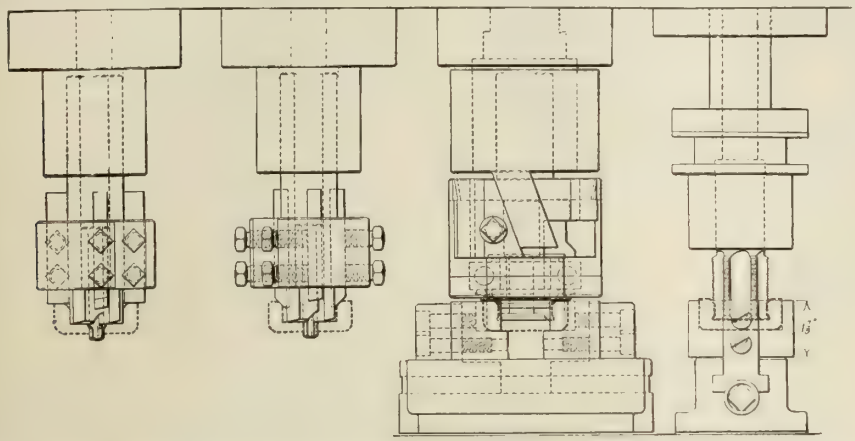

FIG. 7. TOOL LAYOUT FOR MACHINING SHRAPNEL SOCKETS—FIRST OPERATION.

Having described some of the more outstanding features of these multiple spindle automatic chucking machines, a recital of the operations involved will now be given relative to the production of shrapnel shell accessory parts.

### Time Fuse Ring.

The time fuse rings Fig. 1, are brass forgings and come to the machine with the holes undrilled. The rough blanks weigh 6 oz., and the finished parts, 4 oz. each. The operations are performed at one setting on a four-spindle machine, tooled as shown on Fig. 4. The parts are gripped in a two-jaw chuck and the plain end faced, drilled and counterbored. To avoid retarding production, a high speed spindle which runs five times the speed of the main spindle is installed on No. 2 spindle, and this opens up the holes so that they can be finished with a counterbore in the No. 3 spindle. The production is 240 per hour and the tool-cutting speed approximately 80 ft. per minute.

### Time Fuse Body.

The time fuse bodies come to the machine as brass forgings, Fig. 1 in dotted lines, and weigh 13 oz. each. They are machined in two settings, Figs. 5 and 6 on a four-spindle machine, and take the finished from full lines, Fig. 1. The parts are gripped in a two-jaw chuck and the large end is bored from the solid, reamed, recessed and tapped and the outside taper turned, faced and threaded. The production from this setting is 55 pieces per hour.

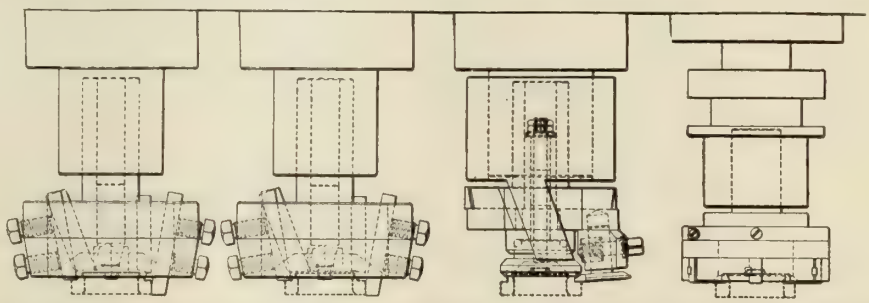

FIG. 8. TOOL LAYOUT FOR MACHINING SHRAPNEL SOCKETS—SECOND OPERATION.

For the second setting the pieces are held in threaded draw-back collets which fit into the thread formed in the previous setting. The head and stem are turned and faced, and the stem chamfered and threaded. The production is 120 per hour, the finished weight of the part, 8 oz., and the tool cutting speed approximately 80 ft. per minute.

A special cross-cut head is used for necking back of the external thread as well as the tapped thread, both operations being performed simultaneously. The long outside taper thread and the tap, while of different pitches, are handled on the same spindle by the aid of a special die head.

### Shrapnel Sockets.

Shrapnel sockets come for machining as solid brass forgings; the rough blank weighing 13 oz. The work is done on a four-spindle machine and consists in the first setting, Fig. 7, of facing, boring, recessing and tapping. The parts are gripped in a two-jaw chuck and the pieces are held on arbors located by the thread formed in the end. In the second setting, Fig. 8, three diameters are turned, the end formed and necked, and the outside threaded. The production for each setting is 120 per hour and the tool speed 116 r.p.m.

### Time Fuse Nose.

The time fuse nose pieces, Fig. 1, are brass forgings and are finished at one setting, Fig. 9, in a five-spindle machine. The forgings are held in two-jaw chucks, and the operations consist of facing, forming, recessing and tapping the inside. A centreing spindle is installed oposite the loading position to straighten up the forgings before chuck jaws are tightened. Special jaws are also used having stops in the back to make front edge facing uniform. The fifth, and last spindle is fitted with a special counterbore to take a light cut over all surfaces which have to be held to close limits. While a production of only 225 per hour has been obtained on these pieces in brass, a production of 320 per hour is attainable when pieces are made of aluminum. The cutting speed is approximately 80 ft. per minute. The finished piece weighs 3½ oz.

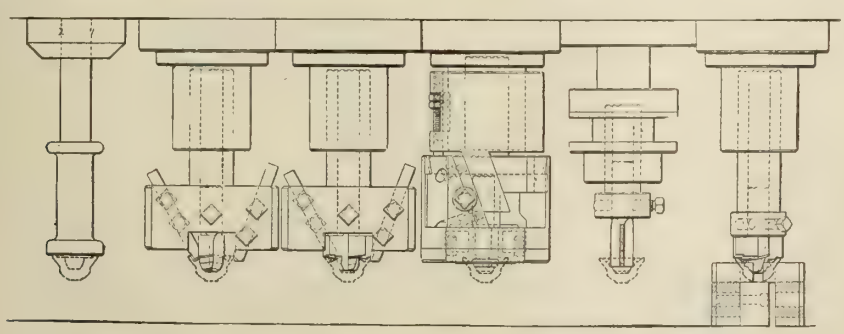

FIG. 9—TOOL LAYOUT FOR MACHINING TIME FUSE NOSE.

### Time Fuse Head.

The time fuse head blanks, Fig. 1, are of machine steel and weigh 15 oz. each. The machine on which the various operations are performed was originally built to special order for handling a second

operation on steel high explosive fuse heads. It is fitted with eleven spindles,

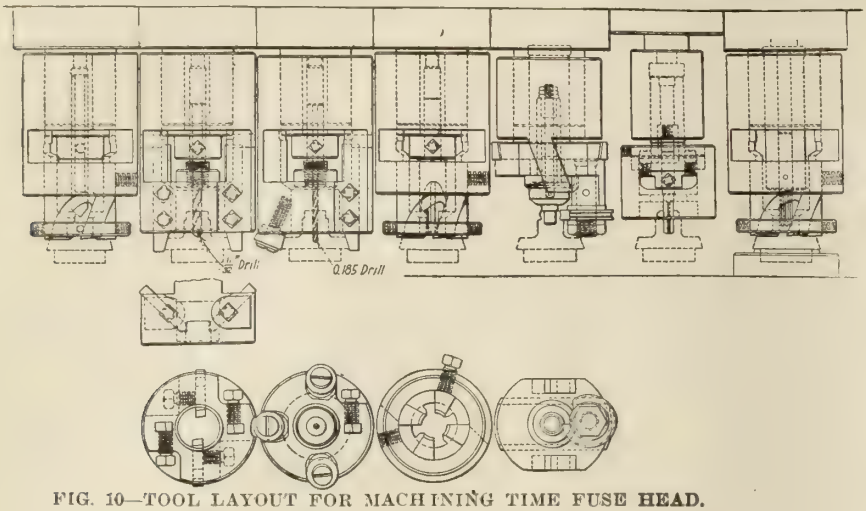

FIG. 10—TOOL LAYOUT FOR MACHINING TIME FUSE HEAD.

four of which are internal spindles operating inside of main spindles 1 to 4. The time fuse head parts are finished in one setting with tool sequence as shown in Fig. 10. They are threaded internally and externally and the ends are machined. The blanks are held on threaded draw back collets, afterwards being machined in the following order:—The hub is drilled, counterbored, tapped, turned on two diameters, necked and threaded, and the flange is faced, grooved and turned. The finished pieces weigh 13 oz. each. The production is 50 pieces per hour, and the tool-cutting speed approximately 40 ft. per minute.

### 4.7 Shrapnel Head.

A notable improvement falls to be recorded in the U.S. method of making shrapnel head from cold drawn steel stampings in place of making same from the bar or from forgings. In the first operation the pieces are centred on stop plugs which act as an accurate gauge for the thickness from the inside recess to the finished face. The material employed permits of a big cutting speed (120 ft. per minute), with fine feed. The resulting quantity of tough, stringy chips which would be troublesomesome in ordinary turning are broken up by an interrupted movement of the facing and turning tools, Fig. 12. Threading by tap and die also presented difficulties in this soft material which were met with special taps and chasers.

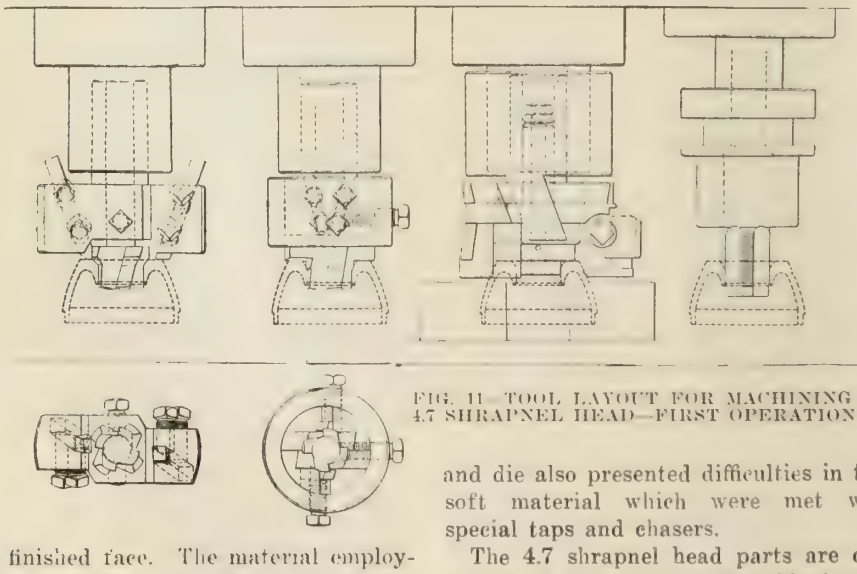

FIG. 11—TOOL LAYOUT FOR MACHINING 4.7 SHRAPNEL HEAD—FIRST OPERATION.

The 4.7 shrapnel head parts are cold drawn steel stampings, the blanks for which weigh 42 oz. each. The finishing is performed on a four-spindle chucking machine in two settings. For the first setting, small end Fig. 1, the pieces are held in two-jaw chucks arranged with stop plugs which fit quite snugly inside and locate them accurately. The operations consist of facing, chamfering, grooving, boring and tapping. The weight of the finished piece is 31 oz., and the production 62 per hour.

In the second setting the pieces are held on threaded drawback arbors by the thread formed at small end. The operations consist of facing, clamping, turning, necking, counterboring and threading. The production for this setting is 90 per hour and the cutting speed about 120 ft. per minute.

### Time Fuse Plugs.

The time fuse plugs, Fig. 1, are brass forgings weighing 6 oz. each and the finishing is done on a standard five-spindle machine with specially designed

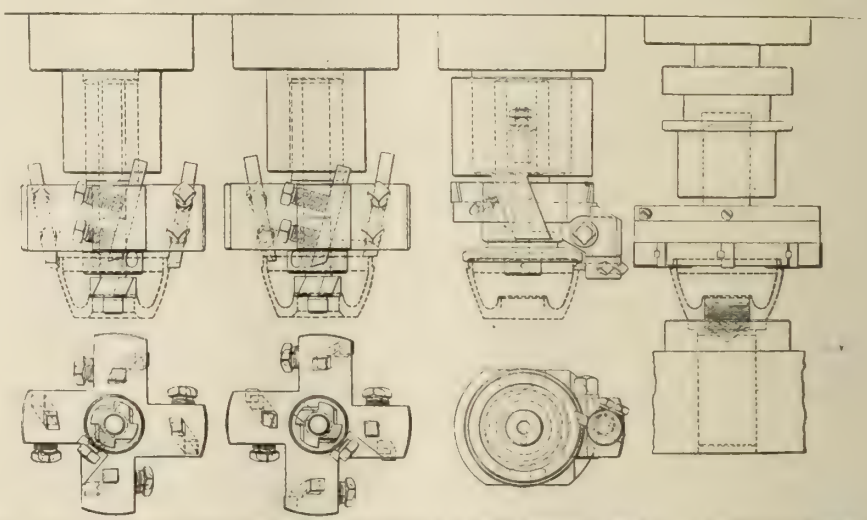

FIG. 12—TOOL LAYOUT FOR MACHINING 4.7 SHRAPNEL HEAD — SECOND OPERATION.

tools, Fig. 13, which handles the forging from the solid. The small internal neck back of the tap presented difficulties for ordinary tooling but this was taken care of in a specially designed necking tool which performed the external necking as well as the internal. The thread and tap having different pitches were taken care of by a specially designed threading head. The finish form for seat was obtained by means of a circular forming tool.

The pieces are gripped in two-jaw chucks and the outside is turned, formed necked and threaded. The inside is formed out with hollow mills, drilled, counterbored, necked back to tap and tapped. The weight of the finished pieces are 3 oz. each, the production 180 per hour, and the approximate tool cutting speed 100 ft. per minute.

### 18 Pdr. H. E. Shell Head.

The blanks for the 18-pounder high-explosive shell heads are brass forgings

and weigh 34 oz. each. The finishing is performed in two settings, the pieces being gripped in two-jaw chucks. In the first setting, Fig. 14, the ends are faced and formed three diameters, then bored, recessed and threaded two diameters. A head has been specially designed for simultaneously cutting two threads of different pitches and the finish form is obtained through circular forming cutters which are stated to have long life. The recess inside back of the internal thread, is formed by a special cross-cut head on the third spindle and bearing a tool for the purpose, and this head has a diagonal sliding motion on a pair of fingers (one of which shows plainly). The head is backed by a powerful spiral spring which tends to keep it forced out-

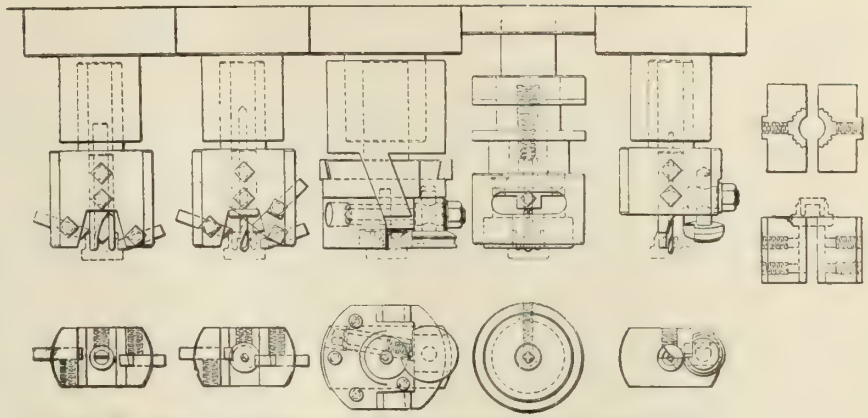

FIG. 13—TOOL LAYOUT FOR MACHINING TIME FUSE PLUG.

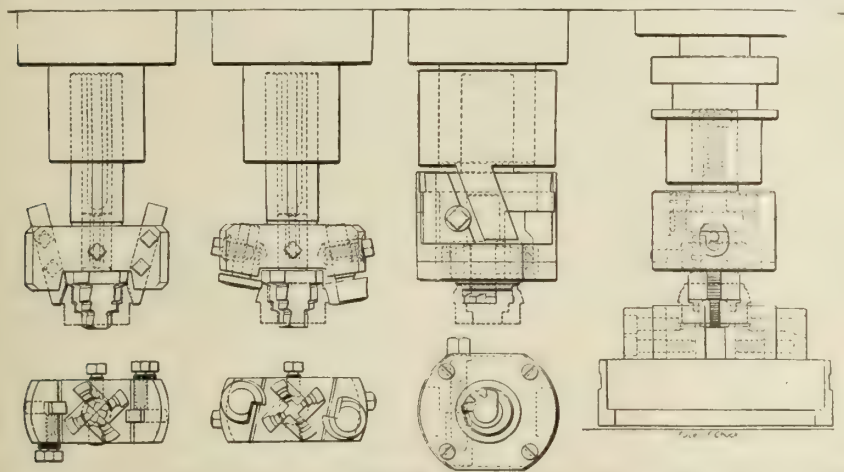

FIG. 14 TOOL LAYOUT FOR MACHINING 18-POUNDER H.E. SHELL HEAD FIRST OPERATION.

ward. As soon as stop comes in contact with work, the head is forced backward. Its diagonal motion gives a lateral movement to the cutter which produces the desired recess. As soon as spindle starts to recede from the work, the head moves out and clears the tool. The fourth spindle carries a combination tap holder. The two internal threads are of different pitch but cut simultaneously. The holder is so designed that the smaller tap having a coarser pitch advances independently of the larger one.

For the second setting, Fig. 15, the

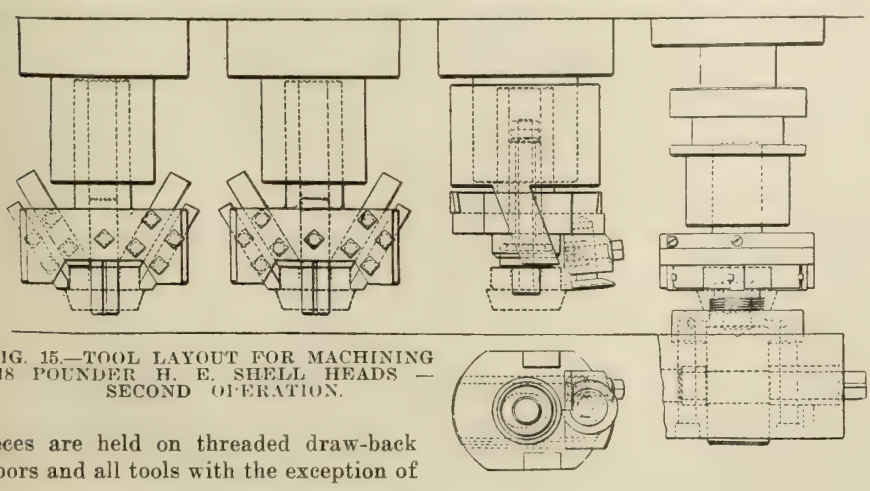

FIG. 15.—TOOL LAYOUT FOR MACHINING 18 POUNDER H. E. SHELL HEADS — SECOND OPERATION.

pieces are held on threaded draw-back arbors and all tools with the exception of the die are piloted in the arbors so as to ensure perfect alignment and concentricity. The machining consists of facing, turning, necking and threading, and the production for each of the two operations is 120 pieces per hour. The weight of a finished piece is 28 oz., the tool speed is about 80 ft. per minute.

### Rotary Cross-Cut Tool.

The rotary automatic cross feed tool is for cutting grooves back of threads and for internal and external cross cuts of any design. The tool is operated by the thrust of the work against two angular wedges and a cross-slide mechanism; the wedges being made with the proper angle to give fast or slow cross motion to the cutter head. This cross motion draws the cutter down into the work and when the work starts to back off a spring in the hollow spindle forces the cutter head out on the wedges and the tool out of the work. For internal work the head is of the same design but the cutter is placed on the opposite side and close to the centre.

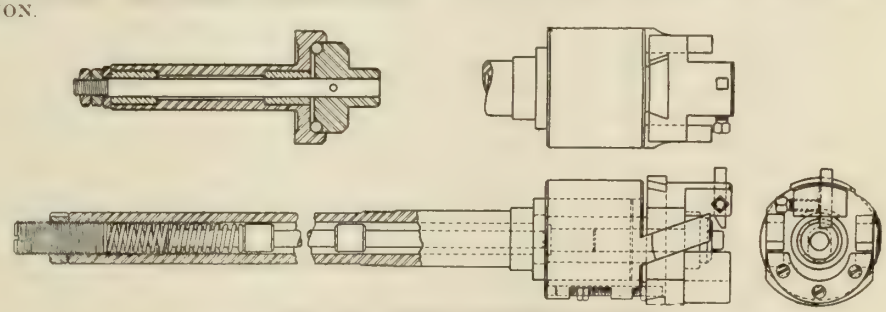

FIG. 16. ROTARY CROSS-CUT TOOL.

**Sidney, N. S.**—The new explosive base manufacturing plant in connection with the Dominion Steel Co., coke ovens for the manufacture of toluol, is now well under way and work is being rushed to have the buildings completed and ready for the reception of the machinery as soon as possible. The main building will be 44 by 60 feet, and 44 feet high. The plant also includes, with other details, three towers twelve feet diameter and fifty feet high, built in series, about four feet apart.

## EXPLOSIVES IN MODERN WARFARE.

A TIMELY and interesting address on the "Use of Explosives in Modern Warfare," was recently given by Dr. J. B. Porter before the McGill University Chemical Society.

### Classes of Explosives.

Explosives, said the lecturer, are usually divided into three classes, viz., low explosives, of which gunpowder is a typical example; high explosives, which must be essentially chemical, and represented by nitro-glycerine; and detonators, exemplified by fulminate of mercury. The difference in the rate of burning of members of the above classes is interesting. When gun-powder is allowed to burn in a loose train, the rate is about six feet per second. Nitro-glycerine will burn at the rate of about 16,000 feet per second, while fulminate of mercury, whether loose or compact, will burn at the rate of 20,000 feet per second.

### Cordite.

Cordite, the standard explosive of the British army, is manufactured by dissolving guncotton in nitro-glycerine in varying proportions and adding a minute quantity of camphor as a preservative. This mixture forms a jelly, which is partially dissolved in acetone and drawn out into fine threads and wound on slowly rotating spools, whereby the acetone evaporates and leaves the cordite in the form of a dry thread. These threads are cut to size and used for the various purposes required.

Other powders used by the Austrians and Germans appear to possess greater initial velocity than cordite, but are not nearly as uniform. Cordite may be kept for a considerable time after preparation and will be found just as effective as a freshly-prepared sample, whereas the other powders seem to deteriorate in time. This feature of cordite gives it a premier position over other types. One disadvantage, however, accruing from the use of a cordite powder is a slight corrosive action upon a gun-barrel, especially if the cordite be moist.

### Explosives for Shells.

In dealing with explosives for shells, the purposes involved must be considered, viz., whether the shell is to be a destructive or a shrapnel shell. The term destructive here implies the use of shells in the reduction of fortifications and for purposes of demolition generally. In a shell of this type melted picric acid is the active material used. This is known ordinarily as lyddite (English) and melinite (French).

A shrapnel shell is one which contains a large quantity of bullets and some suitable explosive to scatter the contents. In this case a smokeless powder is not desirable, as the artilleryman is able better to direct his fire by watching the smoke following the bursting of the shell. Such shells are equipped with time fuses.

For submarine torpedoes, compressed wet guncotton is almost universally used —fulminate of mercury serving as the detonator.

Rapid cutting explosive effects may be produced by using a so-called "necklace" of guncotton wound about the steel rail, bridge girder, etc., where the section is desired to be removed.

## HEAT TREATMENT OF SHELLS.

By D. B. H.

I AM presenting here a few suggestions to those who are for the first time in their mechanical experience tackling a proposition entirely new to them—that is, doing work such as shrapnel shells, which, when finished, must stand a critical test, showing 100 per cent. efficiency.

To obtain those results they will find it necessary to banish the old system of working by rule of thumb. They must also eliminate the common forge, which has been a considerable handicap in producing efficiency in the heat treating of their former lines such as cutters, dies, punches, etc.

To be successful in shell manufacturing I would advise that you install along with other machines necessary for the work gas or oil furnaces, and you will, of course, require several of them for the heating, noseing, drawing, etc. To obtain uniformity and efficiency in the heating, I would suggest also the use of a four-record recording pyrometer, for by having this outfit you will have a continuous record of the temperatures in all your furnaces, and will make it absolutely certain that you are obtaining the proper results.

As the carbon content is the main element which regulates the critical point in steel, I would suggest that the manufacturer engaged in shrapnel work keep in close touch with the laboratory, so as to know that he has the right material to work with. By using care in working along the lines suggested there is no reason why the specifications required by the Government cannot be comfortably filled.

## MUNITIONS OF WAR EQUIPMENT.

ONE feature of the multiplicity of equipment being installed for the production of munitions of war is that of the mechanically operated press as distinct from what is known as the hydraulic press. Large orders are being placed for the former both in Canada and the United States, one purpose being the manufacture of different sizes of brass cases for shrapnel shells of all three—British, French and Russian—type. One such equipment to our knowledge has recently been supplied to a leading Canadian Cartridge Co. by the E. W. Bliss Co., New York.

The latter firm, we have also discovered, have supplied a large number of automatic presses for the manufacture of lead composition balls for shrapnel shells, and among the interesting features to be observed in connection therewith may be mentioned the fact that some of these machines make 12 balls at one stroke, while another style of press, smaller in size, makes but one ball at a time. In both styles of machines the lead is fed in strips from reels, the entire operation of the presses being automatic.

We observe also that large quantities of special machinery for the manufacture of rifles is being furnished both Canadian and American factories whose business lies in that particular direction by the Bliss Co., and in these days, when quality product and quick delivery are of the very highest importance to those engaged in the manufacture of the actual implements of war, it is apparent that the above concern's experience in and facilities for building and delivering machine tools must necessarily be of a very high order.

## COPPER AND THE WAR.

UNDER the above heading, a special correspondent to the "Times" quotes some most interesting figures, and makes some equally interesting deductions concerning the expenditure of copper necessary for the immediate use of the belligerents.

The writer conservatively estimates the number of rifles in use by the combined German and Austrian armies as averaging 1,300,000. At 20 rounds per man per day this means 26,000,000 shots for every 24 hours. A rifle cartridge weighs about 184½ grains, and this means that about 305 tons of brass is used daily for rifle fire. Adding 10 per cent. for the Maxims, the total becomes 335 tons. Of this only a small percentage is recovered, say, five per cent., which means a net expenditure of 318 tons.

For artillery fire it is estimated that the enemy use 150,000 shells per day, and this means 105 tons of brass per day. The copper in the brass forms 72 per cent. of the metal, and, therefore, the enemy require for this alone 309 tons of copper per day, or about 112,000 tons per year.

In time of peace, Germany can produce 26,000 tons per year, which, at the present time, might possibly be brought up to 36,000 tons per annum. After allowing for the small amount which Austria produces, the net deficiency amounts to 72,000 tons.

Canada, $2.00; United States, $2.50; Great Britain, Australia and other Colonies, 8s. 6d. per year; other countries, $3.00. Advertising rates on request.
Subscribers who are not receiving their paper regularly will confer a favor by letting us know. We should be notified at once of any change in address, giving both old and new.

Vol. XIII. MARCH 18, 1915 No. 11

## PRINCIPAL CONTENTS.

**Shrapnel Shell Service and Constructional Features** .....203-204

**General** .....204-206
Manufacture of Shrapnel....Notes on Ordnance....Range Finding Afloat....Range of Naval Actions....Engineering Achievement of the War....Field Artillery of Belligerents.

**Machining Shrapnel Shell Cases and the Tools Employed**..207-209

**General** ..... 209
Big German Gun a Myth....Small Arms of Belligerents.

**Development of Our Nickel-Copper Smelting Industry** ....210-215

**Manufacturing 18-Pounder Shrapnel Shells in Canada** .....216-219

**General** .....
Machine Gun Features....Big Guns....Canadian Shell Committee....New Type British Submarine.

**Shrapnel Shell Grinding Methods Briefly Outlined**.....220-221

**General** ..... 221
Trade Returns for February.

**Progress in New Equipment** .....222-228
Shell Production on Standard Machines....Shell Marking Machine....Three New Machines for Projectile Work....Gun Rifling Machines....Gun Boring Lathes ....Lathe Turrets for Shell Manufacture....14-in. Heavy Automatic Shrapnel Lathe....Cutting-off and Facing Machine.

**General** .....227-228
Shell Manufacture at Hamilton, Ont.....Recent British Navy Additions....Transporting British Reinforcements.

**Finishing Shell Parts on Automatic Chucking Machines**...229-233

**General** ..... 234
Explosives in Modern Warfare....Munitions of War Equipment....Heat Treatment of Shells....Copper and the War.

**Editorial** ..... 235
Munitions of War Manufacture.

**Selected Market Quotations** .....236-237

**The General Market Conditions and Tendencies** .....237-238

**General** ..... 239
Equipment for Australian Railways....French Government Inquiry.

**Industrial and Construction News** ..... 240

## MUNITIONS OF WAR MANUFACTURE.

THAT this many-nation-involved war was unquestionably thrust upon us, no better proof is necessary than the realization that in the fall of last year we were as an Empire what might aptly be termed shockingly unprepared for its advent; our fleet of course excepted. We are to-day, however, well past the unprepared stage, and who shall say otherwise than that now we are not only well prepared and in a position to maintain our accomplishment, but to rapidly and continuously improve on it.

Previous to the outbreak of war, business of every description throughout the length and breadth of our Dominion was more or less "under the weather," and, immediately following, enterprise of every kind round about us practically collapsed. The latter condition did not long prevail, however, for those at the head of affairs, even in spite of already heavy burden bearing, took hold of the Empire reins with the result that the wheels of factories at the Empire Heart itself began to revolve faster than ever before, as well as those of her Dominions, and such other countries as displayed the necessary good sense and appreciation of the circumstances.

It is an often heard remark, that we Canadians are at a loss to know what would have become of us had these prolific munitions of war orders not materialized. The prevailing opinion, and possibly a quite natural one is that almost every department of industrial enterprise would have ceased to be. Just why, however, we should incline to dote on what might have been, had the already mentioned war-equipment-for-war-pursuit orders not materialized, we are at a loss to know, except that the panic and stage fright engendered last August is being to some extent still nurtured.

It is not a question of what Canada would have done, and may not necessarily even be a matter of contentment with and gratitude for what she is getting to do as a result of the war. The question is more really—are we getting all we might and perhaps should, and, if not, is it because we are not getting after all that is going and are indifferent in the matter of equipping ourselves to but do it? We understand for instance, that orders for many thousands of aluminum fuse caps for shells are awaiting being placed when their manufacture is ready to be taken advantage of by some of our enterprising concerns, and while we do not in any sense aver that a surprisingly high percentage of the equipment being supplied the Allies by the United States could have been manufactured equally as well in Canada, we do think that a few additional lines and an increased contribution to those already being produced would not come amiss.

Our machine shops and machine tool manufacturers have benefited in large measure from the placing of shell orders, but the disposition to treat the work as being only of a temporary or stop-gap nature, here also militates against going into the business whole-heartedly. None of us realize as perhaps we should the gigantic nature of the struggle in which our Empire with her Allies is engaged, nor do we, except in a very small way, appreciate the abnormal demand for war material.

Among other things more or less important, we trust the issuance of this Shell Number of Canadian Machinery will be timely in drawing attention not only to the work in progress, but to its still further pursuit and development.

In the matter of our supplementary and general articles dealing with munitions of war, in this issue, we have drawn from a number of already published statistics and take pleasure in acknowledging our indebtedness for the privilege. Further articles relative to shell manufacture, etc., will appear in immediately succeeding issues.

# SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

## PIG IRON.

| | | |
|---|---|---|
| Grey Forge, Pittsburgh | | $13 45 |
| Lake Superior, charcoal, Chicago | | 15 75 |

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Montreal, Que., March 15, 1915.**—The iron and steel markets have been very quiet during the last week. The recent rail orders secured by the Algoma Steel Corporation from the Illinois Central have created more or less interest. In other mills, however, no new business has been reported, although they already have quite a considerable number of orders on their books. Pig iron is very dull, and is only moving in small lots. Machine tools are also generally dull. The metal markets keep firm but quiet.

### The Steel Market.

Last week, 25,000 was the tonnage of rails reported to have been ordered by the Illinois Central from the Algoma Steel Corporation. The exact tonnage has since been officially stated, however, to be 35,000 tons of 90-lb. open hearth steel rails. An interesting feature of the situation is that our Canadian mills have been able to get this business. Recently a Canadian railway purchased rails from the Algoma Steel Corporation. These had to pass the rigid inspection of the "nick and break" test and their quality was so high that such a crucial test did not increase the normal number of rails rejected by less rigid tests; in fact, it acted slightly in favor of the mill. This order placed by the Illinois Central also carried with it the stipulation that all

rails were to pass the "nick and break" inspection.

Railways have been experiencing great difficulty in getting mills to have their products so tested. It is therefore all the more significant that the Algoma Company has allowed its product to be subjected to such a test and still has been able to meet the prices of American mills located on the Illinois Central Railway. These achievements go a long way to substantiate the claim of the Algoma mills that they turn out the best standard rails in America.

**Pig Iron.**

The pig iron situation changes but little from week to week. The prices all underwent more or less adjustment on the budget announcement, and since then no changes have been recorded. Orders being received are all of the small variety and the total volume of business passing is also small.

**Machine Tools.**

The demand for turret lathes and grinders still continues and the manufacturers are working hard to give early delivery. At the present time over 200 Canadian shops are engaged in making shells, and this has naturally created a lugs demand for certain classes of machine tool specialties. Heavy tools are not moving at all, and constitute stock which is very difficult to dispose of. The supply business is thriving on the war orders as the very best materials must be employed to secure accurate work.

**Metals.**

The metal markets have been extremely quiet. Practically no changes in prices are reported. Existing prices, are, however, firm. Several shipments of tin from London to New York have been reported and although the quantity in each is not stated, it is felt that delivery in New York will tend to ease the high price now being asked. Spelter is firmer, while copper is quiet. Antimony continues to be a scarce article, while aluminum is quiet.

---

**Toronto, Ont., March 16.**—The slight improvement in industrial conditions noted last week has been maintained, and the outlook is better. It should not be forgotten, however, that a considerable portion of the business that is now keeping the factories running is on account of military equipment, which does not necessarily represent actual development in the industrial field. On the other hand, it is a very useful substitute for normal business, which, under prevailing conditions, is conspicuously absent. When these orders have all been placed and completed there will be another period of adjustment pending a return to normal conditions. The higher tariff will no doubt eventually help Canadian manufacturers, but conditions at present are such that it is difficult to form a definite opinion as to what extent Canadian industries will benefit.

In the mechanical engineering field the recently-organized shell industry is the most important feature. The enormous demand for ammunition renders this industry of the greatest importance. Arrangements are now being made for the manufacture of shells of still larger calibre.

Indications do not point to any marked activity in municipal works this season. A difficulty in financing civic improvements is being experienced and fewer tenders are being called for material and equipment than is usual at this period of the year. The steel trade is quiet. The building trade is not showing any signs of revival, and many manufacturing interests are operating considerably under capacity. The metal markets continue to show strength, tin, spelter and antimony having advanced from 3c to 6c per pound. A revival in the machine tool trade is to be noted this week and considerable activity is anticipated on account of the orders for large calibre shells about to be placed.

**Steel Market.**

Conditions in the iron and steel trade are much the same as have prevailed during the past few weeks. There is, however, a beter tone in the market. The amount of steel being used for shells is increasing, and plants engaged in this business are very busy. The Algoma Steel Corporation of Sault Ste. Marie, Ont., has booked a further order for rails from the Illinois Central Railroad, making a total of 36,000 tons from that road alone. In addition, they have received an order for 80,000 tons from the C.P.R. The Algoma Mill has recently booked 60,000 tons from railroads in the States, including the Illinois Central. Prices as a rule are firm, and there are few changes to note. Wire nails are now being quoted at $2.35 base, representing an advance of 15c. The new discounts on cold-drawn steel shafting are 40 per cent. at mill, and 30 and 5 per cent. at warehouse. Galvanized sheets are very firm and liable to advance any time on account of the high price of spelter. Tin plate manufacturers in the Pittsburgh district have announced an advance equal to $3 a ton.

**Pig Iron.**

There is nothing of interest to note in the pig iron market except that the Victoria furnace at Port Colborne, Ont., may be blown in some time this month.

**Scrap Metals.**

The light demand for scrap continues, but prices are firm, especially copper and brass scrap. Heavy and tea lead have advanced ¼c, and are now being quoted at 4¼c and 3¼c per pound respectively.

**Machine Tools.**

Machine tool dealers report a better demand for shell-making machines, and a large number of enquiries have been received this week. These tools are for the larger calibre shells, and preparations for their manufacture are now being made. The tools most in demand are 16-in., 18-in. and 20-in. engine lathes and high power drilling machines. The shells range from the 18-pounder high explosive lyddite to the 6-in. shell. Some interesting business is expected, as there will no doubt be a very large number of concerns engaged in the production of these shells.

**Supplies.**

A better feeling prevails in the supply trade, although conditions are under normal. Prices on brass goods have been withdrawn until the lists have been revised. It is anticipated that the new lists when issued will show an advance all round. Most brands of tool steel have advanced, and there is a better demand for the best grades of high-speed steel. Linseed oil is up 1c per gallon, raw oil being now quoted at 72c and boiled at 75c per gallon. No change in the prices of steel and metallic tapes is contemplated for the present.

**Metals.**

The feature of the metal markets during the past week has been the sharp advance in tin, spelter and antimony, due to strength in the London market. Tin advanced 6c, spelter 3c, and antimony 4c per pound. All markets locally are firm, but the volume of business is comparatively light.

**Tin.**—Shortage of supplies of spot tin in London appears to have been the cause for the sharp advance of 6c. The market also has been excited over the tin situation as regards shipments. Tin is quoted locally at 56c.

**Copper.**—The market is irregular and the situation unchanged. The market, however, is strong in New York on a large export demand. Local quotations are firm at 16¾c for lake copper, an advance of ¼c per pound.

**Spelter.**—The market continues completely upset and demoralized, quotations being more or less nominal. There is no spelter offering locally. Quotations are now 3c higher at 15c per pound.

**Antimony.** — The antimony market continues very strong at the late advance, prices on Cookson's and Hallett's being entirely nominal. Antimony has advanced 4c, being now quoted at 25c per pound.

**Lead.**—The market is quiet, but firm, at unchanged prices. Lead is quoted locally at 5¾c per pound.

**Aluminum.**—The market is unchanged at 23½c per pound.

## EQUIPMENT FOR AUSTRALIAN RAILWAYS.

TENDER forms, specifications and drawings have been received from D. H. Ross, trade commissioner, Melbourne, for equipment required by the Victorian State Railway, particulars of which together with the closing date being briefly outlined as follows:

| Contract. | Date Closing. | Equipment. |
|---|---|---|
| 28,453. | April 21, 1915 | Hollow chisel mortisers. |
| 28,467. | April 28, 1915 | Twelve storage battery trucks. |
| 28,523. | May 5, 1915 | 1,000,000 steel spring washers. |
| 28,533. | May 5, 1915 | Electrical switches, voltmeters, etc. |
| 28,558. | May 19, 1915 | 1,600 dust-shields for axle boxes. |
| 28,561. | May 19, 1915 | Pneumatic moulding machine. |
| 28,562 | May 19, 1915 | Four high speed drilling machines. |
| 28,463. | June 2, 1915 | Electric lighting materials. |

The departure of mails from Vancouver and San Francisco, in respect to the Victorian railway tenders, are indicated thus:—

From Vancouver, March 17, due Melbourne, April 10.

From SanFrancisco, April 13, due Melbourne, May 4.

From Vancouver, April 14, due Melbourne, May 8.

From San Francisco, May 11, due Melbourne, May 31.

**French Government Inquiry.**—Advices from Ottawa state that the following materials will be needed in France for reconstruction work of all kinds:—Lumber, squared and logs, for frame work and joinery; sectional iron and steel for frame and railways; machine tools for timber; machine tools for iron; metallic bridges and frames, fixed and adjustable; lumber bridges and frames, fixed and adjustable; lifting apparatus, such as cranes, trucks, crabs, etc.; tools for earth-work, quarries, pile-drivers, such as steam clams and shovels, perforating machines, mining crowbars, shovels, picks, etc.; tools for the crushing of stone; tools for the manufacture and utilization of mortar and concrete; transportation material used on public works, stock yards, such as wagons, portable railroads, locomotives and locomobiles, auto trucks and carts, wheelbarrows, etc.

**A. P. Scott**, lately metallurgical engineer of the Dominion Iron & Steel Co., Ltd., of Sydney, N.S., has severed his connection with that company and will shortly remove to Montreal where he will locate as a consulting metallurgist. Mr. Scott is well known in Montreal and has had a wide experience in American and Canadian iron and steel works.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

## CANADIAN TRADE COMMISSIONERS.

**Argentine Republic.**

H. R. Poussette, 278 Balcarce, Buenos Aires. Cable Address, Canadian.

**Australasia.**

D. H. Ross, Stock Exchange Building, Melbourne, Cable address, Cancoma.

**British West Indies.**

E. H. S. Flood, Bridgetown, Barbados, agent also for the Bermudas and British Guiana. Cable address, Canadian.

**China.**

J. W. Ross, 6 Kiukiang Road, Shanghai. Cable Address Cancoma.

**Cuba.**

Acting Trade Commissioner, Lonja del Comercio, Apartado 1290, Havana. Cable address, Cantracom.

**France.**

Phillipe Roy, Commissioner General, 17 and 19 Boulevard des Capucines, Paris. Cable address, Stadacona.

E. J. Wilkinson, Durban, 41 St. Andrew's Buildings, Durban, Natal.

## CANADIAN HIGH COMMISSIONER'S OFFICE.

**United Kingdom.**

W. L. Griffith, Secretary, 17 Victoria Street, London, S.W., England.

# INDUSTRIAL AND CONSTRUCTION NEWS

**Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.**

## Engineering

**Ottawa, One.**—The Cowie & Moore Co., engineers, contemplate erecting a machine shop.

**Winnipeg, Man.**—A fire at the plant of the Manitoba Welding & Mfg. Co., on March 6, did damage which estimated at $3,000.

**Sidney, C.B.**—The Dominion Steel Corporation will install a plant for the utilization of by-products of the coke ovens to manufacture tutol and benzol.

**Toronto, Ont.**—At a meeting of the Boving Company, of Canada, Ltd., held here on March 6, it was decided to wind up the business in Lindsay and close the factory up after filling all the orders on hand at the present time.

**Fredericton, N.B.**—The water pumping station plant and building and T. R. Kent Co.'s drilling plant at the Dominion experimental farm of this city, were totally destroyed by fire on March 11. The loss is estimated at $80,000.

**Ottawa, Ont.**—A central heating system for the Court House and County Jail on Nicholas street, is practically assured, and work on the installation of the new system is expected to be started during July or August of this year. The installation is expected to cost between eight and ten thousand dollars. The Carleton county council has the matter under consideration.

**Montreal, Que.**—The Harbor Commissioners new elevator will be begun just as soon as the spring comes. The contract for the foundations has been awarded, and as soon as the concrete base is in position work will begin on the superstructure. The new elevator will be erected immediately west of No. 1, and will increase the capacity of that one to about 1,800,000 bushels as the addition will be large enough to hold three quarters of a million bushels.

## Electrical

**Regina, Sask.**—The Canada West Electric Co. contemplate building a factory here to cost $3,000.

**Petrolea, Ont.**—According to Engineer J. J. Jeffery, of the Ontario Hydro-Electric Commission, Petrolea, Oil Springs, Wyoming and Sarnia will have hydro power within the next few months

**Newmarket, Ont.**—About ten tenders have been received for transformers, meters and wiring for the extension to the local electrical system.

**Toronto, Ont** — Ontario Hydro-Electric Commission will start work in the spring on the proposed power canal from Chippawa creek to Queenston, where a large generating plant is to be constructed.

**Hamilton, Ont.**—The Hydro Board has announced a new scale of rates for light and power, which amount to about 10 per cent. less than the former rates. The old lighting charges were 4 cents per 100 square feet and 3 cents per k.w. hour, and are now 3 cents per hundred square feet and 2½ cents per k.w. hour.

**ALLIES PURCHASING AGENTS.**

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**British—Col. A. G. Barton and A. C. Billing, Ritz Carlton Hotel, Montreal.**

**French—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.**

**Russian — Messrs. S. Ruperti and Aiekieff, care Military Attache, Russian Embassy, Washington, D.C.**

**Merchants Power Co.**—The annual meeting of Merchants Light, Heat & Power Co., which is controlled by the interests represented in Cedars Rapids Manufacturing & Power Co., was held recently, and resulted in the re-election of the Board of Directors. The directors and officers are: J. S. Norris, president; H. Murray, vice-president; D. Lorne McGibbon, R. M. Wilson, Julian C. Smith, directors, and James Wilson, secretary.

**Cedars Rapids Board.**—Two new members have been added to the Board of Directors of Cedars Rapids M. & P. Co., namely, Sir Herbert Holt and Mr. Norton Otis, of London. The board and officers of the company are now as follows: —President, J. E. Aldred; vice-president, Howard Murray; general manager, J. C. Smith; superintendent of operation, R. N. Wilson, and Sir Herbert S. Holt, J. S. Norris, D. Lorne McGibbon, Arthur V. Davis and Norton Otis.

## General Industrial

**Zurich, Ont.**—The Zurich Flax Co. have sold their mill to Arnold Heideman.

**Bedford, Que.**—The Bedford Mfg. Co., will probably re-build their factory providing more adequate fire protection.

**Lethbridge, Alta.**—It is stated that the C. P. R. has lodged an injunction against the removal of the Knight Sugar Co. plant from Raymond, Alta., to Layton, Utah.

**Toronto, Ont** —Fire on March 14 totally destroyed the plant of the Wagstaff Brick Mfg. Co. The company carried no insurance. A. H. Wagstaff is manager.

**Guelph, Ont.**—At a meeting of the directors of the Sterling Rubber Co., recently, it was decided to erect an addition to the building at once in order to meet the requirements of the rapidly growing trade of the company.

**Guelph, Ont.**—A deal has been completed by some local capitalists whereby they will take possession at once of the Raymond manufacturing plant, which has been lying idle for almost a year. J. G. Sully of this city is interested in the new company, which will make sewing machines.

**Sherbrooke, Que.**—The terms of the lease between the City of Sherbrooke and Julius Kayser & Co., the New York silk glove manufacturers, who are establishing a branch of their business here, have been agreed to by the city council. The company is leasing the building on Frontenac street known as the "Water Power Co. premises," for a period of three years.

**Montreal, Que.**—The Canada Consolidated Rubber Co. have decided upon a million-dollar preferred stock issue. The proceeds of the new issue will be used to increase the equipment at the Berlin tire factory, enlarge the department for the complete manufacture of rubber

THE A. R. WILLIAMS MACHINERY CO. LTD.

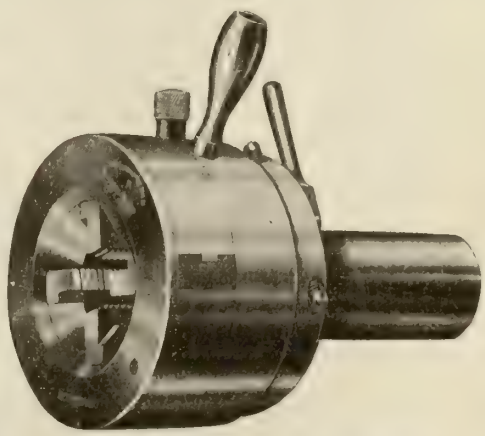
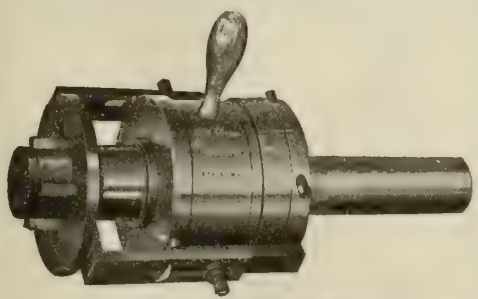
# Here Are Tools That Help to Perfect Shrapnel Shells

**Geometric Self-Opening Die Heads and Collapsing Taps Give True, Clean Threads Always**

Therefore, when the demands of Shell Making became urgent, they were ready for the closest test.



Geometric Self-Opening Die Head



Geometric Collapsing Tap

Every owner of a Screw Machine or Turret Lathe using Geometric Threading Tools knows that no one is better equipped for threading, not only Shells, but every part that requires a Screw Thread.

Self-opening Die Heads for cutting 1-16-inch diameter and up to the largest diameter required.
Collapsing Taps for tapping any diameter above ¾-inch.
OUR STANDARD:—Finest Quality, Greatest Quantity, at Least Outlay.
Catalogue upon request.

**The Geometric Tool Company, New Haven, Conn., U.S.A.**

Canadian Agents:
Williams & Wilson, Limited, Montreal. The A. R. Williams Machinery Co., Limited, Toronto, Winnipeg, St. John, N.B.

clothing, recently established, provide funds for the installation of certain machinery in connection with the reclaiming plants, which are to be reopened immediately and strengthen the company's position generally.

## Municipal

**Ottawa, Ont.**—The proposed incinerator is estimated to cost $13,000.

**Welland, Ont.**—The county council has decided to build 45 miles of good roads this year. The cost is estimated at $200,000.

**Grimsby, Ont.**—On the recommendation of Fire Chief Walker, the council has decided to purchase a 60-gallon chemical engine.

**Vancouver, B.C.**—A by-law for $230,000 for waterworks purposes will be submitted to the ratepayers in the near future. F. L. Fellowes, city engineer.

**Owen Sound, Ont.**—The city may build a half million bushel grain elevator and go into the business as a municipal enterprise.

**Hespeler, Ont.**—A by-law will be voted on by the ratepayers on March 29, to grant a fixed assessment of $64,000 to the Stamped & Enamelware Co.

**London, Ont**—If the city accepts Engineer Willis Chipman's recommendation for the present year's work, there will be an expenditure of $211,000 on storm sewers.

**Aylmer, Que.**—The Provincial Government has approved of the by-law for the extension of the intake pipe. Tenders will be called for the building of the pump house.

**Bedford, Que.**—The council are contemplating installing a waterworks system. A by-law will be submitted when the cost has been estimated. Marvin Smith is the mayor of Bedford.

**Bridgeburg, Ont.**—The town council may instal a motor-driven pump with a capacity of 500 gallons per minute. A larger intake pipe may also be necessary.

**Lindsay, Ont.**—An effort is being made to have the Boving by-law submitted again to the ratepayers. A previous by-law to guarantee the company's bonds for $30,000 was defeated recently.

**Ottawa, Ont.**—J. B. McRae, engineer for the insurers' Committee of the Board of Trade, appeared before the waterworks committee at the request of the chairman and gave it as his opinion that the overland pipe to Lemieux Island construction will begin within fifteen days.

**Chatham, Ont.**—At a meeting of the Board of Trade, held on March 11, it was decided to start out on an active campaign to advertise the superior advantages of Chatham as an industrial centre.

**Port Arthur, Ont.**—The by-law bringing all electrical utilities under the new commission on March 5, was carried by a large majority. The majority was 368 and the poll stood 445 votes for the commission and 77 votes against other utilities than the hydro-electric one coming under the commission.

**Hamilton, Ont.**—In the supplementary estimates for Ontario, provision is made for the following improvements to public buildings in this city: Normal school, motors for ventilating fan and installation, $600; hospital for the insane, additions, alterations and repairs to steam and electric plants, plumbing and machinery, including engineers' supplies, $5,500; electric elevator, main building (part revote), $1,000; water service, $2,500.

## Railways-Bridges

**Toronto, Ont.**—The Toronto Suburban Railway Co. have taken out a permit for the erection of a new transformer station, to be erected on Bay Street, at a cost of $4,500. Tenders will be called for immediately.

**Toronto, Ont.**—Works Commissioner Harris has asked the Committee on Works for authority to advertise for tenders for the steel bridge to be erected in connection with the proposed roadway through Mount Pleasant Cemetery. The cost is estimated at $40,820.

**Otawa, Ont.**—A new measure, introduced by Mr. Stewart, of Hamilton, before the Railway Committee confirms an agreement amalgamating the Toronto, Hamilton, and Buffalo Railway Co., and the Erie & Ontario Railway Co., with powers subject to the Railway Act, to raise $15,000,000 for the construction of branches and wharves and the purchase of vessels and rolling stock. Under the act the amalgamated company could construct a network of electric railways.

## Trade Gossip

**Canal Charter Extended.**—The House of Commons last Friday gave the third reading to a bill to extend the charter of the Georgian Bay Canal.

**The A. B See Electric Elevator Co. of Canada, Ltd.**, Montreal, has been awarded a contract for two freight elevators in the examining warehouse at Quebec, by the Department of Public Works.

**The Steel Company of Canada** will remove the Toronto city office about April 1 from 69 Bay street to the ninth floor of the Traders' Bank Building.

**Sherbrooke, Que.**—The Board of Trade has appointed a committee to look into the advisability of sending a representative to London for the purpose of securing orders for the steel and iron industries of Sherbrooke.

**Metals Chemical, Ltd.**, has been incorporated at Ottawa, with a capital of $1,000,000 to take over the business of Metals Chemical Co., Ltd., of Welland, Ont. The company who smelt and refine cobalt, nickel and silver propose to extend their plant.

**The Turbine Equipment Co, Ltd.**, Toronto, have sold to the John Ver Mehr Engineering Co., also of Toronto, the following motor driven De Laval centrifugal pumps: one 2-million gallons, two 1 million gallon, and two 500,000-gallon capacity.

**"Made in Canada" Campaign.**—Mr. William P. Fitzimonds, industrial commissioner of the G. T. R., states that he is already the recipient of a large number of communications from United States manufacturing companies requesting information regarding suitable sites for the location of Canadian factories, and for information as to the progress which the new campaign is making in the Dominion.

**Smith's Falls, Ont.**—A new power company has been formed at Merrickville with a capital of $80,000, the organization meeting being held at that place on March 9, when the following officers were elected: G. F. McKimm, president; R. W. Watchorn, sec.-treas., and Messrs. A. L. Mills, T. F. Kyle and Alex. Mills, directors. The new power house is fast nearing completion and will be at once modernly equipped.

**The E. H. Mumford Co.**, incorporated in May, 1905, when E. H. Mumford resigned as secretary and treasurer of the Tabor Mfg. Co., Philadelphia, is again engaged in the molding machine business, with headquarters at Front and Franklin Streets, Elizabeth, N.J. A complete line of molding machines is being designed and manufactured to meet the requirements of the foundry trade, and, while these will be interchangeable with previous types of Mumford machines, they are to be redesigned to meet every requirement of latter-day molding machine practice. By a singular coincidence Mr. Mumford is again taking up the molding machine business at the same

# Cowan Transveyor

## Transporting Shrapnel Shells

The Illustration shows a Transveyor transporting shells from the Artillery Shop to the Shrapnel Shop, where they are to be reamed out to exact size. In each skid load there are 180 3″ cases, weighing 6 lbs. each. One man, with the Cowan Transveyor, easily handles this 1,080-lb. load with no lost motions and a great saving of time.

**The Cowan Trucking System will do as much to revolutionize within-the-factory trucking as the big Krupp guns have done to the methods of modern warfare.**

## Price and Style Range Covers Entire Field

Cowan Transveyors are made in 5 styles and 6 sizes. Prices range from $92 to $2,400. Throughout the entire field of manufacture there is hardly a business to which the Cowan Trucking System cannot be adapted. Its use is always accompanied by a triple alliance of savings—time, labor and floor space.

Photo Showing Use of Cowan Transveyor in United States Arsenal

**Write for price list and specification chart.**

Such firms as

**John Bertram & Sons, Ltd., Dundas;**

**Goldie, McCulloch Co., Ltd., Galt;**

**Canadian Cartridge Co., Hamilton, etc., etc.,**

have purchased these Transveyors for use in making shrapnel.

## Toronto Type Foundry Co.

**LIMITED**

**TORONTO, MONTREAL WINNIPEG**

place where in 1895 he joined Harris Tabor in the development of the first vibrator molding machine.

## New Incorporations

**Metals-Chemical, Ltd.**, has been incorporated at Ottawa, Ont., with a capital of $1,000,000 to manufacture chemicals and other preparations at Toronto, Ont. Incorporators: W. Gilchrist, H. Stewart, and V. Hughes, all of Toronto, Ont.

**The Deakin Construction Co.**, has been incorporated at Ottawa, Ont., with a capital of $50,000, to carry on business as builders and contractors at Montreal, Que. Incorporators: E. E. Howard, J. DeWitt and H. C. McNeil, all of Montreal, Que.

**The Standard Valves Co.** has been incorporated at Ottawa, Ont., with a capital of $50,000, to manufacture all kinds of heating and cooling apparatus, automatic or otherwise, at Ottawa, Ont. Incorporators: W. H. Wallace, H. Burnet and E. P. Cameron, all of Ottawa, Ont.

**Canadian Electric Time Switch Co.**, has been incorporated at Toronto, Ont., with a capital of $100,000, to manufacture electrical apparatus of all kinds at Toronto, Ont. Incorporators: J. J. Greenan, H. D. Anger and R. D. Hume, all of Toronto.

**The London Mfg. & Machinery Co.**, has been incorporated at Toronto, Ont., with a capital of $45,000, to manufacture machinery, tools, ammunition, etc., at London, Ont. Incorporators: H. F. Whetter, M. C. Grant, and G. J. McCartney, all of London, Ont.

**The Standard Valves Co.** has been incorporated at Ottawa, Ont., with a capital of $50,000 to manufacture all kinds of heating and cooling apparatus at Ottawa, Ont. Incorporators: Hugh Burnet, W. J. Wallace and J. Baird, all of Ottawa, Ont.

**Newray Mines, Ltd.**, has been incorporated at Toronto, Ont., with a capital of $1,000,000 to develop mineral lands and deposits. Head office at Toronto, Ont. Incorporators: J. T. White, H. Ferguson and K. W. Wright, all of Toronto, Ont.

**Universal Electric Co.**, has been incorporated at Toronto, Ont., with a capital of $100,000, to manufacture electrical apparatus of all kinds at Toronto, Ont. Incorporators: J. G. Greenan, H. Dell Anger and R. D. Hume, all of Toronto, Ont.

**The Ingersoll, Packing Co.**, has been incorporated at Ottawa, Ont., with a capital of $1,000,000, to carry on business as packers at Ingersoll, Ont. Incorporators: C. C. Lumsden Wilson, J. H. Thomas and C. H. Sumner, all of Ingersoll, Ont.

**The Dominion Truck & Transportation Co.** has been incorporated at Toronto, Ont., with a capital of $1,000,000 to manufacture transporting and weighing devices at Toronto, Ont. Incorporators: J. M. Forgie, H. Riley and R. H. Green, all of Toronto, Ont.

**The Hungerford Talc Co.** has been incorporated at Toronto, Ont., with a capital of $50,000 to develop mineral lands and deposits. Head office at Toronto, Ont. Incorporators: W. H. Wallbridge, Toronto, Ont.; Harry B. Hungerford and M. B. Orde, all of Chicago, Ill., U.S.A.

**Ontario Wrecking & Construction Co.** has been incorporated at Toronto, Ont., with a capital of $40,000 to carry on the business of all kinds of wrecking and building operations at Toronto, Ont. Incorporators: Maurice Goldstick, C. Lurie and B. Alexandroff, all of Toronto, Ont.

**The Axle Valve Co.** has been incorporated at Ottawa, Ont., with a capital of $200,000 to acquire the Canadian rights in an invention known as the Axle Valve, a mechanical device for lubricating axles. Head office at Montreal, Que. Incorporators: H. J. Trihey, P. Bercovitch and E. Lafontaine, all of Montreal.

**United Shoe Machinery Co., of Canada, Ltd.**, has been incorporated at Ottawa, Ont., with a capital of $1,000,000 to take over the business of the United Shoe Machinery Co., at Montreal, manufacturers of boot and shoe machinery. Incorporators: F. W. Knowlton, E. M. McDougall and Gilbert S. Stairs, all of Montreal, Que.

## Contracts Awarded

**St. John, N.B.**—The Phoenix Foundry has received a large order for shrapnel shells.

**T. McAvity & Sons, Ltd.**, St. John, N.B., have been awarded a contract for brass plugs for shrapnel shells.

**Vancouver, B.C.**—The Vancouver Engineering Works have been awarded a contract by the city for the supply of a number of castings.

**Peterborough, Ont.**—The Wm. Hamilton Mfg. Co. have received a large order from the British War Office for the manufacture of 35-pound lyddite shells.

**Winnipeg, Man.**—The contract between the Northern Electric Co. and the city for 2,500 feet of copper cable wire has been approved, also that of the McClary Manufacturing Co. for street name-plates.

**Newmarket, Ont.**—The Canadian General Electric Company were last Monday awarded the contract for the supply of wire, some 23,000 feet, together with the transformer and other necessary equipment for the transmission of power for which contracts have already been entered into with the Metropolitan Railway Co. The equipment will cost about $12,000.

**Hamilton, Ont.**—The following contracts have been awarded for the city's supplies for the year:—Valves—Kerr Engine Co., Walkerville; hydrants—Brown, Boggs Co., Hamilton; pig lead and lead pipe—Tallman Brass Co., Hamilton; cast iron extension boxes—Forewell Foundry Co., Berlin; gray iron castings—Canada Iron Corporation; cast iron pipe and special castings—Gartshore, Thompson Co., Hamilton.

**Ottawa, Ont.**—The following contracts for supplies have been awarded by the city:—Brasswork, H. Mueller and Mfg. Co., Sarnia, $2,435; special pipe castings, C. M. Maas & Co., Ottawa, $3.25 per cwt.; lead pipe and pig lead, McKinley & Northwood, $6,605; oils and grease, Imperial Oil Co., $849.75; cast iron pipe, National Iron Works, Ltd., of Toronto, $64,455.65; valves, divided between McDougal's, Limited, and The General Supply Co., of Ottawa, Ltd.

## Tenders

**Welland, Ont**—Tenders are being called for the installation of a fire-alarm system. J. G. MacMillan, chairman water commissioners.

**Victoria, B.C.**—Tenders will be received up to Monday, April 5, 1915, for the following water meters: 25 1-inch, 10 1½-inch, 12 2-inch, 3 3-inch, 1 4-inch. Specifications may be seen at the office of W. Galt, the city purchasing agent.

**Fredericton, N.B.**—Tenders will be received at the Department of Public Works, Fredericton, until March 31, 1915, for constructing the steel superstructure of a new bridge, to take the place of the present wooden highway bridge at Moncton over the Petitcodiac River; one through fixed riveted steel truss span of 355 feet from centre to centre of end bearings; four through fixed riveted steel truss spans of 261 ft., 6 in. from centre to centre of end bearings, according to plans and specifications to be seen at the Public Works Department, Fredericton, N.B. John Morrissy, Minister of Public Works.

**Vancouver, B.C.**—Tenders will be received up to March 31, for the supply

# A Page with our Readers

THIS IS OUR SHELL NUMBER! It is the first we have ever issued, and, we hope, the last.

The majority of our largest metal-working shops are now engaged in the manufacture of Shrapnel. Ploughshares are, almost literally, being turned into swords by tens of thousands.

This new industry was thrust upon Canadian manufacturers with startling suddenness. We hope that the very shells they are now turning out will be instrumental in bringing the conflict to a speedy close.

In the meantime the duty of the hour is to make shrapnel shells for the well-manned guns of the allied troops.

It is the business of Canadian manufacturers to turn out these shells as expeditiously and as EFFICIENTLY as possible, and in order to contribute to this efficiency we have issued a Shell Number.

In it our editors have gathered together a great deal of information pertaining to the actual operating methods adopted in various shops and by representative manufacturers.

In the advertising section will be found many lines of machine tools and equipment suitable for use in the economical production of shells, and every manufacturer needing additional equipment will do well to examine closely into the lines illustrated and described in this issue.

We would suggest that you preserve your copy of our Shell Number for reference purposes. The almost improbable requirement of to-day may prove to be the urgent necessity of to-morrow.

Anyway you will find this issue an interesting souvenir of the world's greatest war and of a time when Canadian machine shops were engaged in this most unusual industry.

# FOR SALE

**Plant Suitable for Manufacture of War Munitions**

The Large Plant of the **Berg Machinery Manufacturing Company, Limited,** situate near the centre of Toronto's water front, and covering about two acres, with suitable buildings and railway siding thereon. The Plant consists of **Machine, Boiler, Foundry, Blacksmith** and **Pattern** Shops, and is adapted for the manufacture of war munitions.

For particulars apply to

**J. P. Langley & Co.,**
Assignees,
McKinnon Building,
Toronto.

## Manufacturers' Agents

We frequently receive inquiries from manufacturers of machinery specialties or supplies, asking us to suggest the names of reliable agents who might be interested.

For the benefit of Manufacturers' Agents who are subscribers to "Canadian Machinery," we maintain a bureau of information regarding agencies available.

We will be glad to hear from reliable agents desiring suitable lines, in order that we may put them in touch with enquiring manufacturers.

State lines you are specially interested in, and see if we can't connect you with something worth while.

Your name will be kept on file and you will be communicated with from time to time, as occasion arises.

of the following articles for the use of the B.C. dredging fleet at Vancouver, B.C., for 12 months ending March 31, 1916: Hardware; packings; Manila rope; wire rope; chain; steam pipe; valves and fittings; oils and greases; paint, paint oils, etc.; hose; brooms and brushes; steel castings. Forms of tender may be obtained at the office of G. B. Hughes, district engineer, Victoria, B.C.; at the office of C. C. Worsfold, district engineer, New Westminster, B.C.; and at the office of J. L. Nelson, supt. of dredges, 614-18 Birks Building, Vancouver, B.C.

**Ottawa, Ont.**—Tenders will be received at this office until Wednesday, April 7, 1915, for the construction of one new chain of buckets, tumblers, together with spare parts, for dredge "Mastodon." Plans, specification and form of contract can be seen and forms of tender obtained at the Department of Public Works, Ottawa, and at the offices of A. Kastella, Esq., mechanical superintendent, Birks Building, Ottawa, Ont.; J. L. Nelson, Esq., supt. of dredges, Vancouver, B.C.; G. B. Hughes, Esq., district engineer, Victoria, B.C.; C. C. Worsfold, Esq., district engineer, New Westminster, B.C.; F. Y. Harcourt, Esq., district engineer, Port Arthur, Ont.; J. M. Wilson, Esq., acting district engineer, Toronto, Ont., and A. E. Dubuc, Esq., district engineer, Montreal, Que.

## Personal

**J. T. MacNaughton,** sales manager of the Dominion Steel Corporation, Sidney, C.B., was in Montreal recently on a business trip.

**Sarnia, Ont.**—Applications will be received for the position of city engineer vacant through the resignation of H. MacLean.

**W. H. Hazlett,** for 15 years with the British Columbia Electric Railway Co., has joined the firm of A. G. Langley & Co., engineers and contractors, Vancouver, B.C.

**C. W. P. Ramsay,** of the C. P. R., who has been appointed commanding officer of the Canadian Overseas Railway Construction Corps with the rank of lieutenant-colonel.

**Michael Helbronner,** partner in Pringle & Company, architects and engineers of Montreal, who rejoined the army directly after the war began, has been appointed engineer for a military district.

**Lieut.-Colonel Lacey R. Johnson,** heretofore general superintendent of the Angus Shops district, Montreal, who since he joined the C. P. R. in 1882, has been actively identified with the general uplift of ideals and service among the railroad employees, has been appointed general welfare agent of the company. This appointment has been made in order to co-ordinate the development amongst the employees of the road, with such organizations as the St. John Ambulance Association, the Safety First movement, the Railroad Y. M. C. A. and athletic associations.

## Marine

**Quebec, Que.**—It is announced that the work on the new dry-dock at St. Joseph de Levis will be recommenced as soon as the weather permits. Messrs. M. P. and J. T. Davis are the contractors for the work.

## Catalogues

**Flexible Shafts** for drilling, grinding and buffing operations are described in bulletin No. 54, being distributed by the Stow Mfg. Co., Binghampton, N.Y. These flexible shafts are shown in combination with electric motors and particulars are given of two types. The Stow two-spindle drill is also described.

**Exide Batteries,** type Z for motor cycle service, are described in a bulletin recently issued by the Canadian General Electric Co., Toronto. A full and detailed description is given of this battery covering its construction and lighting capacity. Tables are included giving the principal dimensions of each type.

**Tumblers** for foundries are described at length in a catalogue No. 113, recently issued by the Whiting Foundry Co., Harvey, Ill. A number of styles are illustrated and the principal features are stated together with tables giving the leading dimensions of each size and other data. Other illustrations show interior views of cleaning rooms with batteries of tumblers installed. Copies may be had free on request.

**Brass Foundry Equipment.** — The Whiting Foundry Equipment Co., Harvey, Ill., has just issued a new bulletin No. 114, dealing with equipment for brass foundries. Among the lines described are brass melting furnaces, cranes, crucible tongs, and tumblers. Each product is illustrated and tables give the principal dimensions. Copies will be mailed free on request to those interested.

**Belt Conveyors.**—The Jeffrey Manufacturing Co., of Columbus, Ohio, have issued a new belt conveyor bulletin No. 167. This bulletin contains 24 pages of interesting illustrations and descriptive matter which give a comprehensive idea of the wide variety and adaptability of the Jeffrey belt conveyer equipments for handling practically all kinds of ma-

**Gorton Engraving Machine**

With this machine an ordinary workman can turn out work better than the most skilled hand engraver in a fraction of the time the hand workman would take.

WHY NOT ENGRAVE YOUR OWN LETTERING OR DESIGNS, EITHER SUNK OR IN RELIEF, ON DIES, MOULDS, TOOLS, LABEL PLATES, ETC., WITH THIS MACHINE AND SAVE MONEY?

terials. A free copy will be gladly sent to intending purchasers of elevating and conveying machinery.

**Brass Foundry Equipment.**—A new 48-page bulletin of more than ordinary merit is being distributed by Frederic B. Stevens, of Detroit, Mich., and Windsor, Ont. All equipment required in a brass foundry is dealt with in its pages, including furnaces, blowers, crucible tongs, core ovens, sprue cutters, magnetic separators, flasks, etc. Each line is illustrated and carefully described, and accompanied by dimensions where necessary. Special reference is made to the various types of crucible furnace using coke, gas or oil fuel.

**The Jeffrey Mfg. Co.**, of Columbus, Ohio, have recently issued a new 48-page bulletin, No. 147, illustrating and describing the prominent features of their complete line of swing hammer pulverizers, giving full information regarding capacities, speeds, horsepower, general dimensions, etc. More than 1,000 of these machines are now in daily operation reducing limestone, shale, gypsum, clay, coal, coke, ores, tankage, bark, oyster shells, rock for road top dressing, and many other materials. A free copy of this bulletin may be obtained by writing to their home office.

## Book Reviews

**The Canadian Mining Manual for 1914**, by Reginald G. Hore, editor of the Canadian Mining Journal, published by the Mines Publishing Co., Toronto. This is the first issue of the manual since it was taken over by the present publishers although several years have elapsed since its inception. The manual contains 273 pages, and gives much valuable and reliable information concerning the mineral resources and the mining industry of Canada. The opening pages are devoted to descriptions of the chief mineral products of Canada, giving particulars regarding location of the deposits and output for 1913. The illustrations in this section are colored to correspond with the natural color of the metal or mineral and form an interesting feature. The succeeding pages contain a series of reviews of the mining industry in the various provinces with the production for 1913. A list of mining companies operating in Canada is included with particulars of each concern. The concluding pages contain a list of Canadian mining companies arranged in order according to product. The manual is fully illustrated and will form a useful book of reference for those interested in Canadian minerals and the mining industry.

## FOR SALE

FOR SALE — A LARGE ASSORTMENT second-hand wood pulleys, cast iron pulleys and hangers, to clear at half-price. Toronto Type Foundry Co., Limited, 70 York St., Toronto.

FOR IMMEDIATE SALE AT HALF COST—furniture factory equipment, either separately or complete. Large surface planer, turbine wheel, shafting, lathe and pulleys, good as new, and water power site. John Waddell, Orono, Ont.

FOR SALE — LATHES, PLANERS, DRILL presses, turret machines, vertical millers, profilers and milling machines. Box 149, Canadian Machinery. (13)

1—17" X 8" GREIVES KLUSHMAN LATHE, 1—16" x 6" Reed lathe. Both tools modern and good condition. Box 11, Dominion Machinery Co., 82 Adelaide St. E., Toronto.

FOR SALE—LAND, BUILDINGS, MACHINery, Plant, Patterns and Stock of The Johnston Foundry Co., Ltd., at Kemptville. Apply to S. J. Law, Liquidator, Kemptville, Ont.

## Genuine Armstrong Stocks and Dies

**Hinged Pipe Vises.**

**Pipe Cutters. Steam and Gas Fitters' Tools.**

**Pipe Machines for Threading Pipe.**

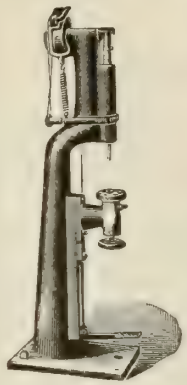
**Either Hand or Power.**

*Manufactured by*

**THE ARMSTRONG M'F'G CO.**

**328 KNOWLTON ST. BRIDGEPORT, CONN.**

**NEW YORK, 248 CANAL ST.**



## Light and Heavy Riveting

can be done equally well on our ELASTIC ROTARY BLOW RIVETING MACHINE because the force of the blow is always under the control of the operator, and quickly adjusted to suit the work.

The machine is made in several sizes and styles, and every head is perfectly formed, any shape you wish.

**Catalogue?**

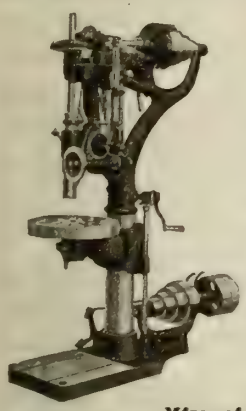
**The F. B. SHUSTER COMPANY**

**New Haven, Conn.**

Formerly John Adt & Son. Established 1866

Also makers of Wire Straighteners, for rounds, squares, hexagons, etc.

Canadian Agents: A. R. Williams Machinery Co., Toronto.



## Our 23" Mechanic's Drill

has features with which you may not be familiar.

There are eight speeds provided, with quick advance and return.

Stationary Head and Back geared with automatic stop. This drill can be motor-driven and will drive high-speed drills to their utmost capacity. The quality is the same as all "Rockford" quality—the best.

**Write for descriptive catalogue.**

## The Garvin Machine Co.

**Manufacturers of**

Milling Machines; Profiling Machines; Cam Cutting Machines; Screw Machines; Monitor Lathes; Die Slotting Machines; Screw Slotters; Tapping Machines; Duplex Horizontal Drills; Gang Drill Presses; Four-Head Right-Angle Drills; Wrenchless Chucks; Spring Coilers; Cutter Grinding Machines; Surface Grinders; Hole Grinders; Hand Lathes and Special Machinery.

**We Want All To Have Our Catalog—Send For It To-day.**

**Spring and Varick Streets, NEW YORK CITY**

## Who's Next on the List?

*Allen Safety Set Screws Prevent Accidents.*

The projecting heads of set screws claim many thousands of victims yearly which Allen Safety Set Screws will prevent. This Screw is different from all other hollow set screws.

**Write for Price List No. 3. Free samples for testing**

**The ALLEN MANUFACTURING COMPANY, Inc.**

**St. Johns, P.Q., Canada**

## NORTON JACKS

**For all kinds of heavy lifting**

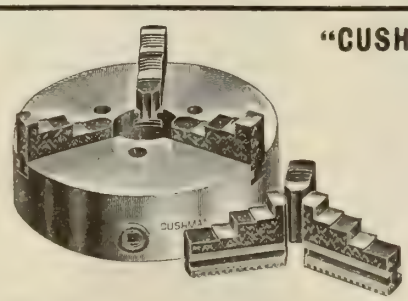
Send for complete catalogue showing 50 styles 10 to 100 tons capacity.

Made only by

**A. O. NORTON, LIMITED**

**Coaticook, Prov. Quebec - - Canada**

## "CUSHMAN" CHUCKS



are generally known as the "heavy pattern," being designed for hard service.

Their accuracy and reliability have been proven over and over again, and the name "Cushman" on your chuck is a guarantee of satisfaction.

Our line consists of many styles and sizes of Lathe Chucks, Drill Chucks, Centering Chucks, and Face-Plate Jaws.

**Catalogue Free.**

**THE CUSHMAN CHUCK CO.**

**Hartford, Established 1862 Conn., U.S.A.**

**1/16 Page** $1.60 per insertion on yearly order.

**Baird Machine Co., Bridgeport, Conn.**

**20 TIMES THE SERVICE**

That's what this self-hardening, high-speed steel chaser does for the LANDIS DIE. Four long cutters tangentially disposed to the work carried in suitable holders make an ideal cutting condition. This, along with its many other distinctive characteristics, has established for us a world-wide reputation.

WRITE FOR CATALOGUE NO. 21.

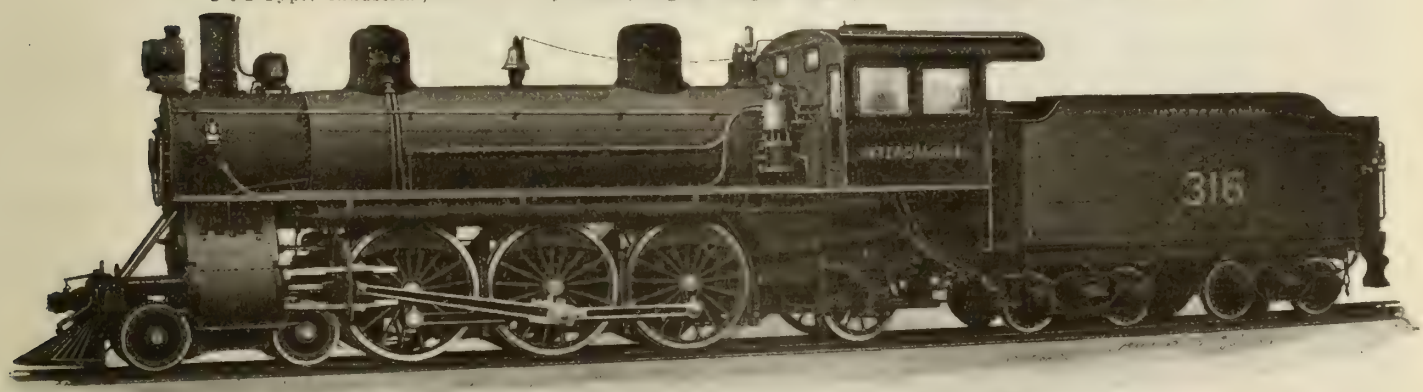
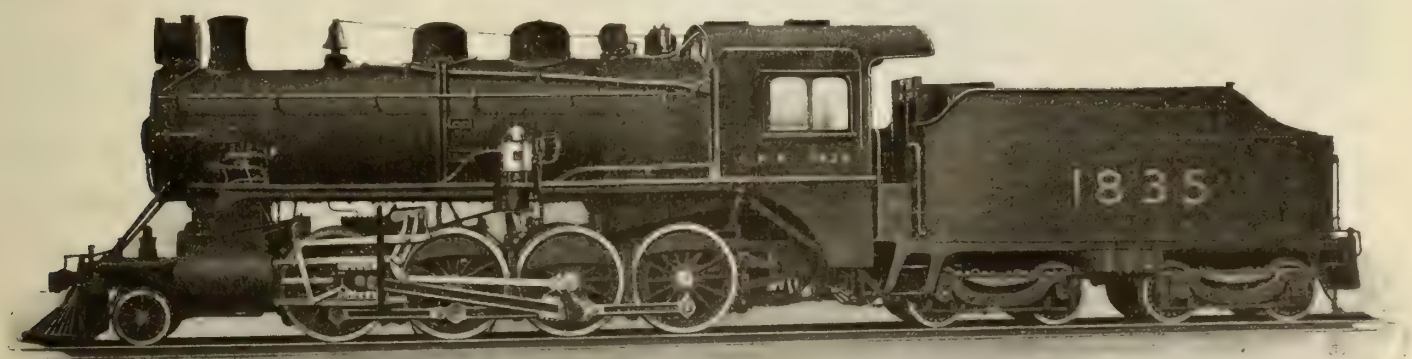
# LOCOMOTIVES MADE IN CANADA

## for contractors, industrial works, railroads, etc.

2-4-2-Type. Industrial, 12" x 16" cylinders, engine weighs 57000 pounds, **tractive power 8000** pounds.



4-6-2-Type. Passenger, 21" x 28" cylinders, engine weighs 187000 pounds, tractive power 29200 pounds.



2-8-0-Type, Freight, 23½" x 32" cylinders, engine weighs 221800 pounds, tractive power 43000 pounds.

Over fifty years' experience, new plant, new equipment, efficient management, expert designers and workmen, builders for all railroads in Canada, are guarantees that OUR LOCOMOTIVES give satisfaction.

**We also make DROP FORGINGS of all descriptions.**

## Canadian Locomotive Company, Limited

**Kingston, Ontario, Canada**

*If what you want is not advertised in this issue consult the Buyers' Directory at the back.*

**Ratchet Wrenches.**
Wells Brothers Co., Greenfield, Mass.

**Railing, Iron and Brass.**
Canada Wire & Iron Goods Co., Hamilton, Ont.
Dennis Wire & Iron Works Co., Ltd. London, Canada.

**Rail Benders.**
Niles-Bement-Pond Co., New York.

**Railroad Tools.**
Can. Fairbanks-Morse Co., Montreal.
Niles-Bement-Pond Co., New York.

**Railroad Tools, Hydraulic.**
Watson-Stillman Co., Aldene, N.J.

**Rails, Relaying.**
Imperial Belting & Supply Co. Montreal.
Herbert Morris Crane & Hoist Co. Ltd., Toronto.

**Rammers, Bench and Floor.**
Guelph Pattern Works, Guelph, Ont

**Rapping Plates.**
Stevens, F. B., Detroit, Mich.

**Raw Hide Pinions.**
Gardner, Robt., & Son, Montreal.
Hamilton Gear & Machine Co. Toronto.
Jones & Glassco. Montreal.
Smart-Turner Machine Co., Hamilton Ont.

**Reamers, Adjustable.**
Can. Fairbanks-Morse Co., Montreal.
Cleveland Twist Drill Co., Cleveland
Morse Twist Drill & Machine Co., New Bedford.
Pratt & Whitney Co., Dundas, Ont.
Wells Brothers Co., Greenfield, Mass

**Reamers, Bridge, Expanding and High Speed.**
Butterfield & Co., Rock Island, Que
Can. Fairbanks-Morse Co., Montreal.
Cleveland Twist Drill Co., Cleveland
Morse Twist Drill & Machine Co. New Bedford.
Pratt & Whitney Co., Dundas, Ont.
Wilt Twist Drill Co. of Canada, Ltd. Walkerville, Ont.

**Reamer Fluting Machines.**
Garvin Machine Co., New York.

**Reamers, Pipe, Cylinder and Locomotive.**
Butterfield & Co., Rock Island, Que.
Can. Fairbanks-Morse Co., Montreal.
Cleveland Twist Drill Co., Cleveland.
Morse Twist Drill & Machine Co. New Bedford.
Pratt & Whitney Co., Dundas, Ont.
Wilt Twist Drill Co. of Canada, Ltd. Walkerville, Ont.

**Reaming Machines, Pneumatic.**
Cleveland Pneumatic Tool Co. of Canada, Toronto.
Independent Pneumatic Too' Co. Chicago.

**Reamers, Steel Taper and Self-feeding.**
Butterfield & Co., Rock Island, Que.
Can. Fairbanks-Morse Co., Montreal.
Cleveland Twist Drill Co., Cleveland.
A. B. Jardine & Co., Hespeler, Ont.
Morse Twist Drill & Machine Co., New Bedford.
Pratt & Whitney Co., Dundas, Ont.
Wilt Twist Drill Co. of Canada, Ltd. Walkerville, Ont.

**Reels.**
Baird Machine Co., Bridgeport, Conn.
Wilt Twist Drill Co. of Canada, Ltd. Walkerville, Ont.

**Rheostats.**
Toronto & Hamilton Electric Co., Hamilton, Ont.

**Rivet Machines.**
Buffalo Forge Co., Buffalo, N.Y.
National Machinery Co. Tiffin O.

**Rivets, Tubular, Bifurcated**
Parmenter & Bulloch Co., Gananoque.

**Rivets, Iron, Copper and Brass.**
Parmenter & Bulloch Co., Gananoque.

**Riveters, Pneumatic, Hydraulic. Hammer, Compression.**

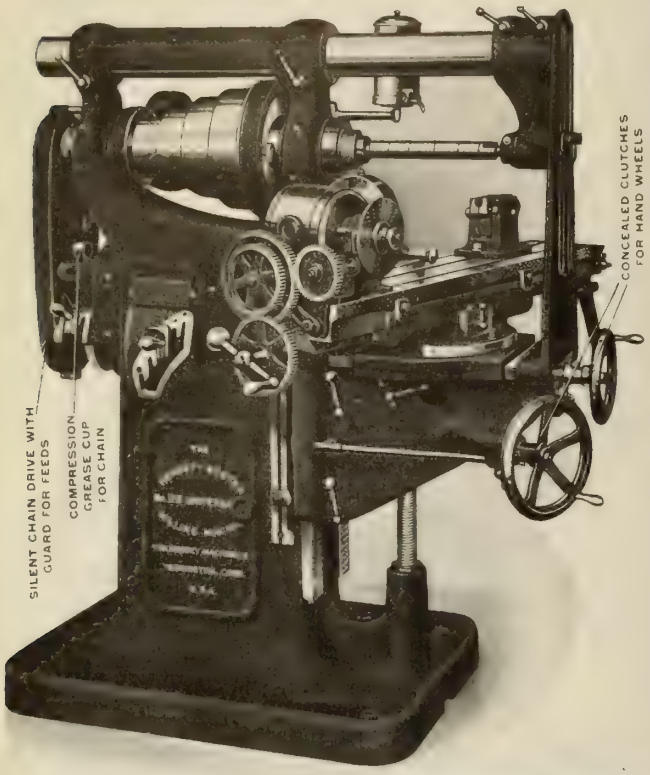
# No. 2B UNIVERSAL MILLING MACHINE



## Sets a new high-mark for efficiency and economy

Main Spindle has taper journals which run in annular bearings.

Constant lubrication is assured by ring oilers which revolve with spindle and pump oil from reservoirs underneath bearings.

Thrust is taken on front bearing, and journals have independent adjustment in either bearing.

Feed Shaft is driven from spindle by heavy silent chain pro tected with complete guard, supplied with compression grease cup for lubricating chain and sprockets.

All Feeds positive driven through gearing, giving 18 changes.

Automatic Feeds can be operated simultaneously and reversed while machine is in motion.

Feed Gearing is Hardened and feeds have independent controls.

Vertical and Cross Feed Hand Wheels have concealed clutches in hubs which allow wheels to run free on shaft when not employed.

Dividing Head is cylindrical in pattern. Supporting Block for Spindle is carried by side plates which recess into block and have annular bearings in ring of main frame.

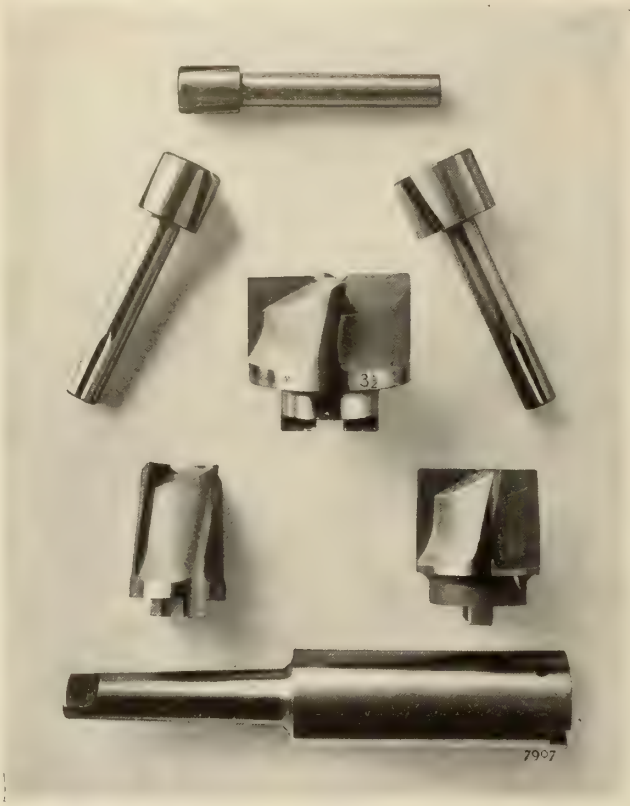
# Make Your Own Combination



For every counterboring job you can select immediately the right combination of holder, cutter and guide if your tool-room is equipped with

## P. & W. Interchangeable Cutter Counterbores

**Holders**

End of holder is milled to receive the driving lug of cutter, and there is a hole in it to accommodate the shank of the guide.

**Guides**

Are of hardened tool steel. They are clamped in the holder by means of a set-screw fitting into a taper V slot in the shank.

**Cutters**

The shank of the guide passes through the hole in the cutter. The shoulder between the guide and its shank keeps the cutter in place. Cutters can be sharpened on the face, and the guide is simply pushed further in the holder after grinding.

*Write for catalog "Small Tools" showing our complete line.*

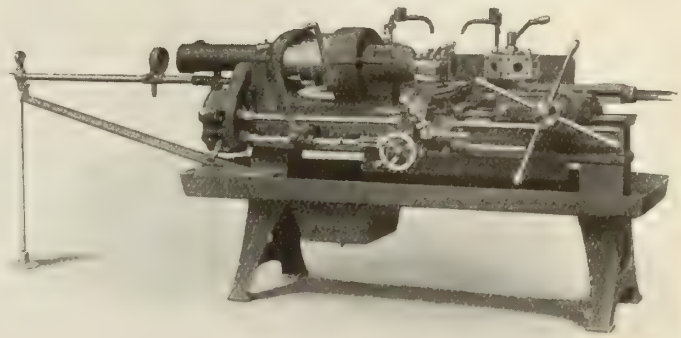
# For Bar Stock, Castings and Forgings

## The No. 4 Universal Turret Screw Machine is equally adaptable for bar and chucking work.

With the simultaneous power operation of both carriage and turret independent of each other, it is possible to conduct two distinct operations at one time, using as many as eleven tools at one set-up.

These features make this machine profitable for manufacturing in large quantities or for the production of a small number of interchangeable pieces.

Ask us to show the profitable application of this machine to your business. Write to-day.



No. 4 Universal Turret Screw Machine

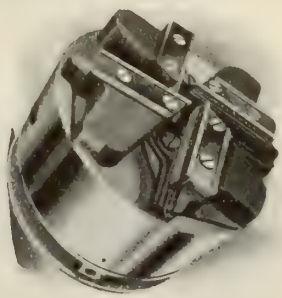
Canadian Agents: A. R. Williams Machinery Company, St. John, Toronto, Winnipeg, Vancouver. Williams & Wilson, Montreal

# In Scientific Selection The Landis Die Predominates



Because,—

The length of the chasers increases its life from ten to twenty times that of the hobbed die.

The line contact the chasers have with the work minimizes the friction at the cutting edges and permits of a much higher cutting speed.

Of the interchangeability of the chasers, which means any one or more of a set can be replaced without renewing the entire die.

Of the right and left hand threading with the same set of dies, a feature accomplished by grinding the opposite ends of the chasers and using right and left hand chaser holders.

Of the uniform hardness of the chasers, which makes it unnecessary to anneal, hob or retemper the die.

**Write for catalogue No. 21.**

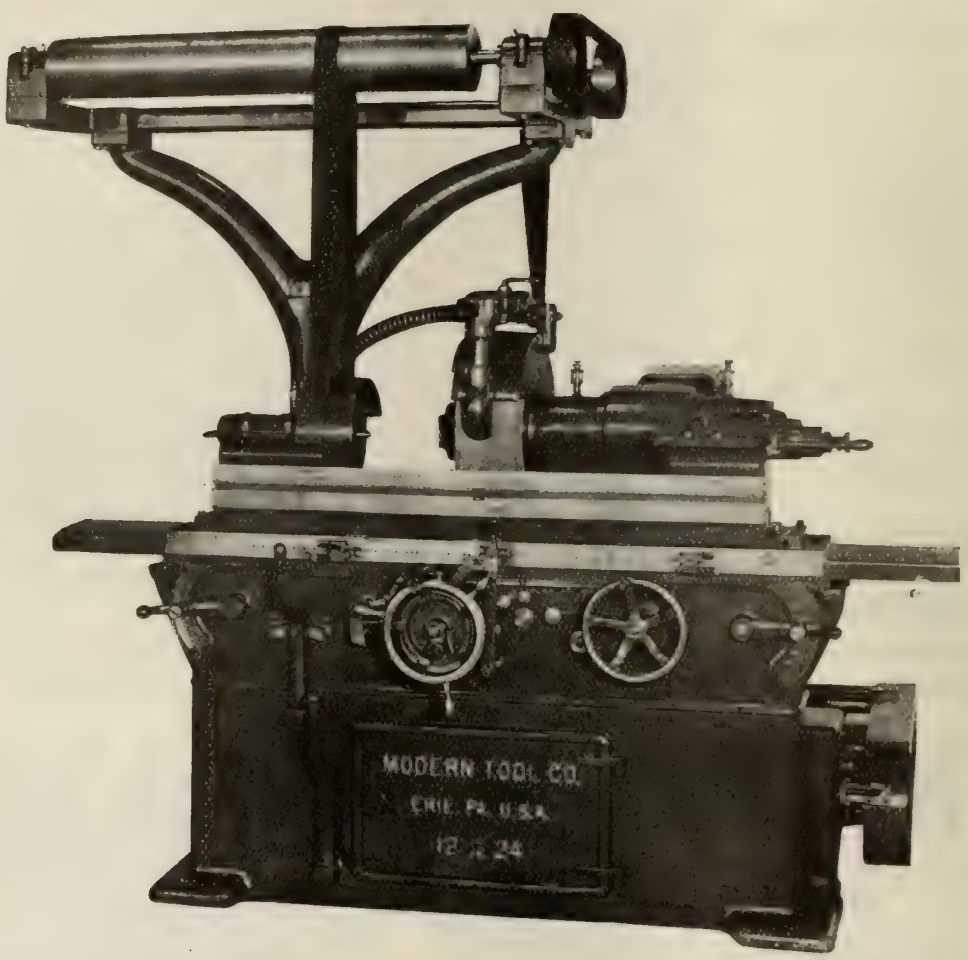
# Finishing Shrapnel Shells

ON THE

## "MODERN" 12" x 24" Self-Contained Grinding Machine



## The heaviest, most powerful and efficient Standard Grinding Machine made for Shell work

The "MODERN" 12" x 24" Grinding Machine is especially adapted for grinding Shrapnel Shells. The Machine is more than guaranteed, it is demonstrated. Large diameter, wide face wheel, with powerful drive—automatic feed without traversing the table—absolute central control of all levers and hand wheels—single constant speed drive.

We have recently sold a large number of these Machines in Canada, completely equipped for Shrapnel Work. Ask the man who is using the "MODERN."

The large manufacturer appreciates the production possible on this Machine. Machine comes equipped for all classes of straight and taper cylindrical work.

**SEND FOR BLUE PRINTS AND ESTIMATES.**

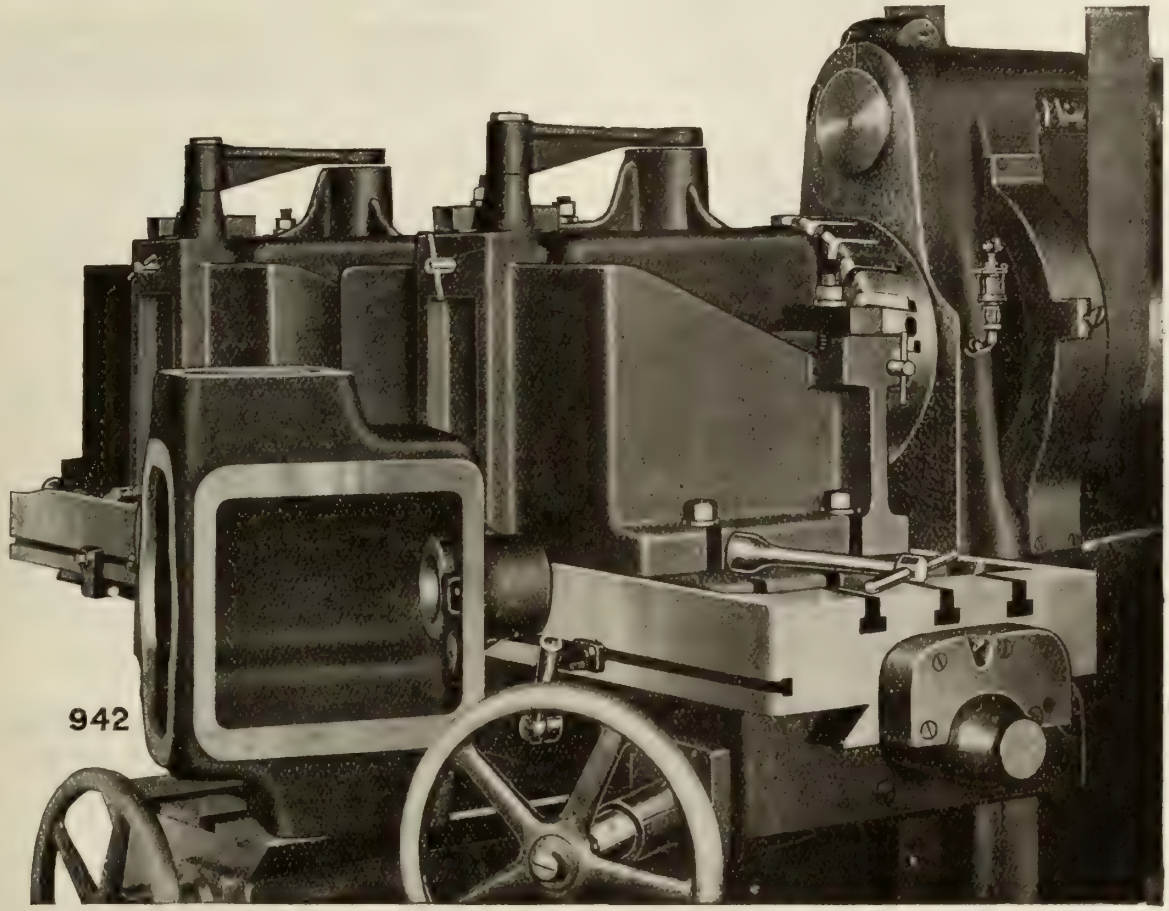
**Main Office and Works:** **State and Peach Streets, Erie, Penn'a**

**Canadian Agents: Rudel-Belnap Machinery Co., Toronto and Montreal**



# THERE ARE LOTS OF JOBS

of milling which require large table travel and chucking space, but do not need great spindle power.

**The crank cases shown are approximately 10″ x 11″.**

Ordinarily they would be milled on a High-Power, single-pulley machine.

In this case they were put on a CINCINNATI NO. 4 PLAIN CONE-DRIVEN MACHINE. A 12″ cutter running 26 r.p.m. at 20″ feed milled these surfaces flat and true in 2.6 minutes.

If you have similar work it will pay you to investigate this machine, as you can save money by buying it.

It is as convenient in operation and as efficient as a high-power miller, but being of simpler construction, it is less expensive.

*Our complete line of millers—cone drive and single pulley —is described in our catalog. Shall we send you a copy?*

# EFFICIENCY

Manufacturers do not hesitate to discard expensive machinery when the time and labor wasted on such old equipment more than offsets the cost of new machines.

Every file should be considered as a machine. At a certain point in its life on any work it becomes so worn that its efficiency is impaired. It is slow—dull—inaccurate. The extra time it wastes in performing its work would more than pay the cost of several new files.

In the interest of efficiency and economy, it should be replaced with a new file—just as old machines are replaced with new equipment.

This "discard" point in any file varies with the skill of the worker and the character of the work. It is very late in the

**"Famous Five"**

**KEARNEY & FOOT**
**GREAT WESTERN**
**AMERICAN**
**ARCADE**
**GLOBE**

***(Made in Canada)***

because they are designed for a long period of maximum service.

They are made by the world's greatest file producers—with an output of 60,000,000 per year. They are manufactured on machines designed to make a tooth that will remove stock rapidly. They benefit by all the skill, experience and knowledge gained in our 50 years' experience. Every step in their manufacture—from steel to finished file—is controlled by us.

Before any of the "Famous Five" leave our works, they must pass tests far more strenuous than any practical work they ever meet.

YOU, too, can cut down your filing cost by using the "Famous Five"—and replacing them promptly when they have lost their efficiency.

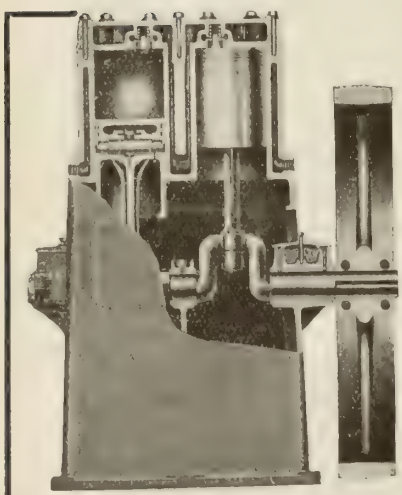
## Vital Factors in Profitable Casting Cleaning

A Good Sand Blast and Cheap Air

# Curtis Sand Blasts

Closed Hopper Sand Blast

Have many features that make them superior.
For instance—Sand screened and Hopper filled at one operation.
LEVER-OPERATED FILLING VALVE is much faster and handier than the usual screwed-in plug or bolted-on cover valves.
HANDY THROTTLE CONTROL that saves time, air and sand.
WATER SEPARATOR that means fewer chokes due to damp sand.
CHOKE RELIEF VALVE that almost instantaneously relieves a choke when one does occur.
GREATER CUTTING ACTION, due to design that insures less drop in pressure between air line and nozzle.—But why not send for a Curtis Blast on thirty days' free trial?



**CHEAP AIR.**

Service tests prove that CURTIS COMPRESSORS will furnish air at minimum cost for operation and maintenance. They have FEWER PARTS than most compressors and less friction loss. Cylinder heads and valves, as well as cylinder walls, are water jacketed (about 80% more cooling area than double-acting compressors), insuring minimum discharge temperature and less loss of power in pipe line. THE VALVES are lightest of all types—tempered steel discs (1-16 inch in thickness)—they require less attention than any other type.

***Write us for Bulletin C-1 and Prices.***

# LIKED AND LARGELY USED BY MARINE ENGINEERS

Department of Commerce and Labor
San Francisco, Cal.
May 24th, 1912.

Gentlemen:—

I am pleased to inform you that on several ships on which I was employed the wrist pin, crank pin and main bearing brasses were lined with Magnolia Metal and gave excellent results.

The ship on which I am at present, the main bearing, crank pin and wrist pin brasses are lined with Magnolia Metal and have given good results for the last six years and are in good condition yet.

With best wishes, I remain,
Respectfully,
Gustav Kleinert, Engr.,
Light Vessel No. 76.

Coast and Geodetic Survey,
Steamer "Endeavor"
Crisfield, Maryland.
May 31st, 1912.

Gentlemen:—

I beg leave to state that I have used your "Magnolia Metal" upon bearings on at least about six different vessels for the past seven years and wish to add that I have always obtained excellent results.

Yours respectfully,
Joseph Zeidler,
Ass't. Engineer.
C. & G. Survey.

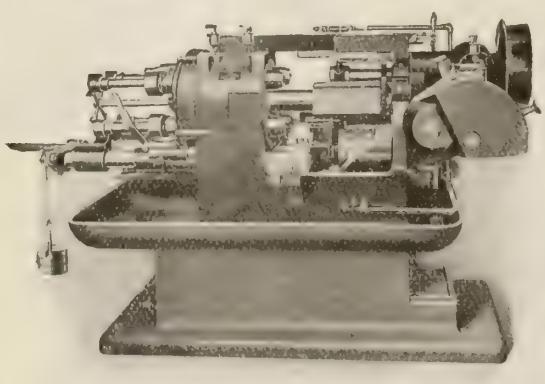
# Gridley Automatics

## SINGLE AND MULTIPLE SPINDLE

Gridley Automatics **GUARANTEE ACCURACY** because the stiffest and most effective type of cutting tool can be rigidly held close to the work without overhang.

"GRIDLEY" Multiple Spindle Automatic



Each tool is supported close to its cutting point, which completely obviates the spring and consequent inaccuracy which cannot be overcome when a necessarily long tool is held by its shank, as is the case with all other automatic turret lathes.

GRIDLEY AUTOMATICS **GUARANTEE A LARGE OUTPUT** because the rigidity of the tool permits heavier cuts and coarser feeds, and its form insures the highest efficiency, while the arrangement upon the tool slide allows for the use of tools tandem, and thereby doubles or trebles the work of a single operation.

**Our catalog,** CONTAINING OTHER DISTINCTIVE GRIDLEY FEATURES, **is ready for mailing.** Be sure to ask for a copy.

# Some Jig Making Practice Considerations and Comment- II.*

By M. R. Lawrence, M.I. Mech. E.

*We have come to look upon jigs and fixtures as such highly indispensable accessories to every class of mechanical engineering equipment manufacture that we may be apt in many cases to press them into service unwarrantably. The writer in this paper seeks to point out that their cost feature should be recorded carefully in every instance so as to ensure that they have been profitably applied, as well as being contributory to quality production.*

IN Part I of this paper, which appeared in our March issue, jig cost and jig design were discussed at length, and an illustrated description given of the initial machining operations on a motor car cylinder and its crank case.

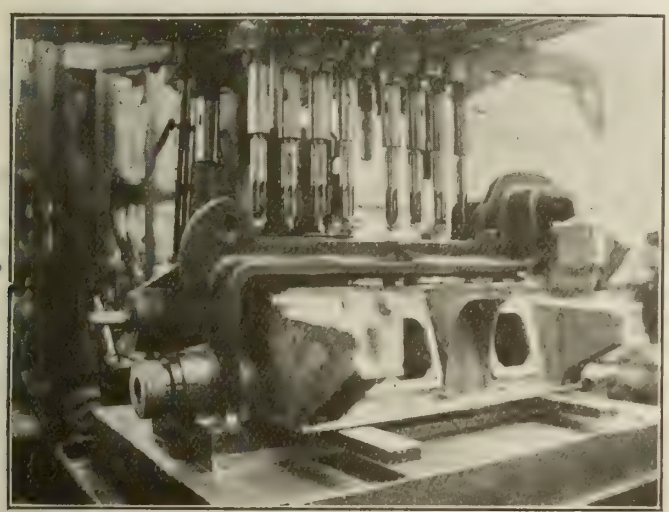

FIG. 9. DRILLING CRANK CASE.

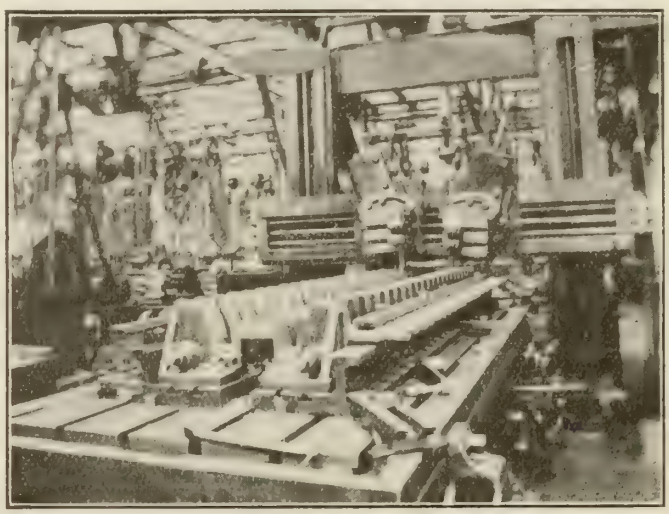

FIG. 10. GANG PLANING CRANK SHAFTS.

A continuation of the procedure relative to the latter is the immediately prominent feature to which attention is directed in the present instance.

The next operation (Fig. 9) illustrates the jig for drilling the cylinder holding-down bolts anl the valve guide-holes. The casting is located in its jig by plug-gauges fitting the bore of the crank-shaft and the cam-shaft, and the taper wedges underneath are adjusted after these plugs are home, to take the pressure of the drills. The jig illustrated has had to be duplicated in order to deal with the quantity in the time, and, therefore, does not carry the cylinder bolting-down holes. This has no disadvantage, as this method of location ensures equal accuracy to both jigs. If any machined faces do not "clean up," or any other irregularities are observed after the castings come from the jigs, it is a clear indication that something is wrong, and that either the casting is of incorrect shape or has been improperly treated. It will then either be thrown out or receive special treatment.

While the machining of these pieces is in mind, the author wishes to call attention to the reason why the castings are dealt with singly, and not mounted on larger machines taking a number at one setting. It is a simple matter to set up one casting true to the scribed lines in this way within the accuracy required; but when more than one has to be mounted, a great deal more care must be taken, because each casting has to be true to the other as well as to the ma-

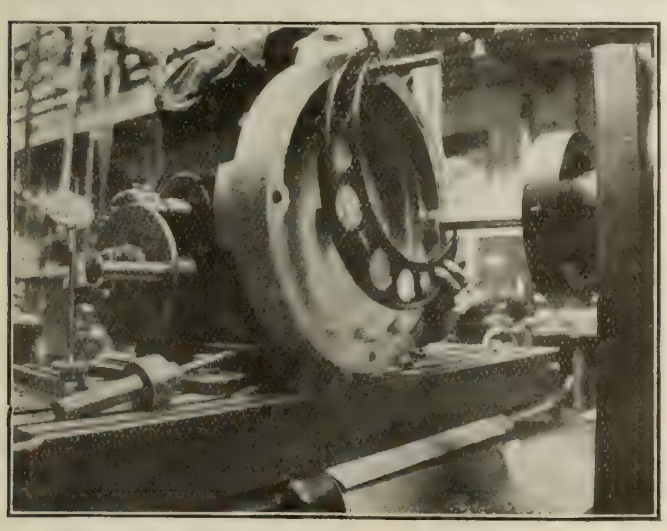

FIG. 11. SETTING OUT DRILL JIG.

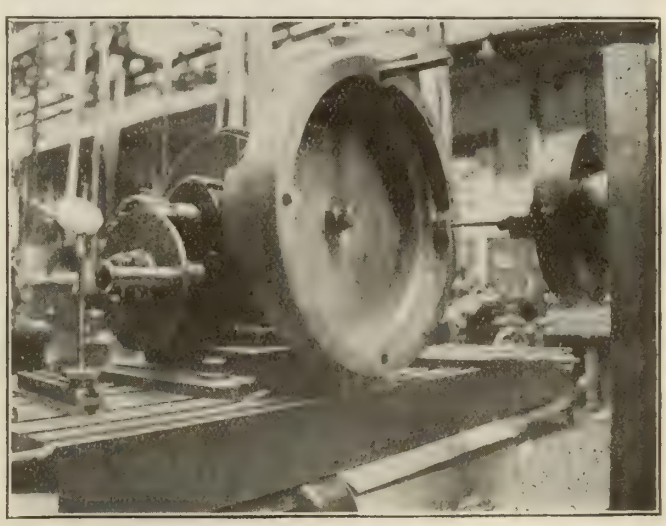

FIG. 12. BORING DRILL JIG.

*Paper read before the Manchester Association of Engineers, December 12, 1914.

It is far more economical to set them up singly on small machines suitably grouped, when two, three, or four can be tended by one operator. The capital outlay in plant, the floor space, the idle time when the cutters are not cutting, and, as a consequence, the operators' wages and the establishment charges, are all less. The only cases where grouping really pays is when the parts can be located from a previously machined face like that illustrated in Fig. 10. This shows a gang of four-cylinder motor-car crank-shafts on a planing machine. The time taken in setting is only that necessary to clean the locating faces and secure the parts.

By far the greater number of jigs that are used are made for correctly locating drilled holes. Figs. 11 and 12 illustrate a good method for making drill jigs where the holes are in circular relation. The illustration depicts a jig carrying four holes, and the method adopted is as follows:—The jig-casting is turned and mounted truly on a dividing-head on a universal milling-machine. One diameter, preferably an outside diameter, is turned accurately to a given dimension. On the cutter-spindle of the machine is mounted a self-centering chuck, in which a true mandrel of known diameter is mounted and set to run true. The table of the machine is then adjusted vertically until the cutter and dividing-head spindles are at the same height, a Vernier gauge being used to measure from the table to the mandrel for the purpose. The table is then adjusted sideways until the centres of the two spindles are the proper distance apart. A Vernier depth-gauge is used to measure from turned diameter of the jig to the true mandrel. A drill a few hundredths smaller than the finished holes is then chucked and the holes drilled, the dividing-head spacing them as desired.

An eccentric boring-bar holder, carrying a single-point cutter, illustrated in Figs. 13 and 14, is then chucked, and the first hole bored out to the desired size. The amount of eccentricity, and, therefore, the size of the hole bored, are readily adjusted by the use of a chuck-key. A plug-gauge is inserted, and the work divided to bring up the next hole. The true mandrel is again mounted in the chuck, and the micrometer used, as illustrated in Fig. 11, to adjust the jig to the exact position, thus eliminating any backlash or any imperfections which may exist in the dividing-head. The boring-bar is again inserted and the hole bored true. The same principle is employed for making a series of holes in line, the lead screw of the table being quite accurate enough on a good universal machine for approximate location for drilling purposes. The plug-gauge, true mandrel, micrometer, and little boring-bar are again used for final location.

Another very useful device for dealing with the rapid production of drilling-jigs, where the holes are not in circular relation to one another, is illustrated in Figs. 15 and 16. The device consists in a cast-iron plate, about 18 in. square, planed all over, and has a number of holes drilled and tapped in it, as illustrated. Two sides are got up dead true and square to one another, to which are bolted two wrought-steel strips carefully machined. A slotted bar is provided, with a truly-ground hole and a series of slip-bushes. The jig is planed square on the two sides and on both faces, and the positions of the holes are roughly set out on it. The jig is then clamped up to one corner, the bush set over the position of a hole which is drilled and reamed through it. The jig is then moved to bring the next hole into position under the bush by placing two circular gauges upon the one side, and the third one upon the other. This hole is then put into the jig, and the position again altered for another, and so forth.

These methods have great advantages. It will be found that standard bushes can be almost universally adopted. They can be manufactured on a capstan or automatic machine from mild steel, and carbonized, hardened, and ground, and

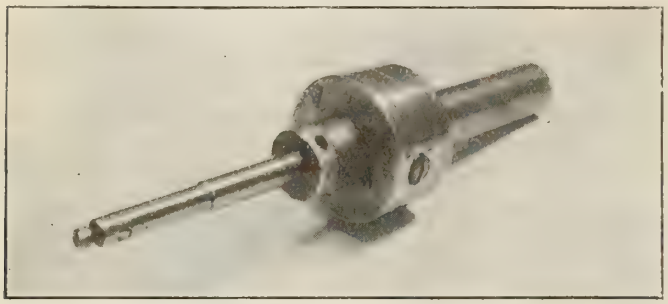

FIG. 13. ECCENTRIC BORING BAR HOLDER.

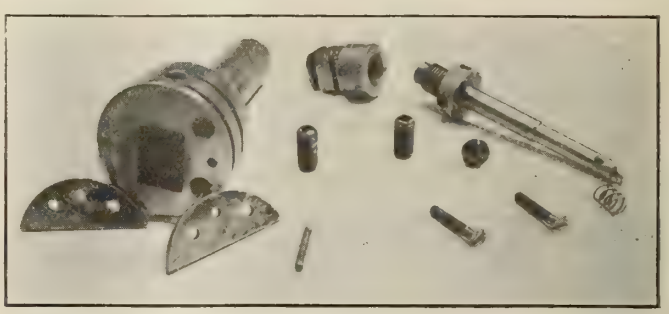

FIG. 14. PARTS OF ECCENTRIC BORING BAR HOLDER.

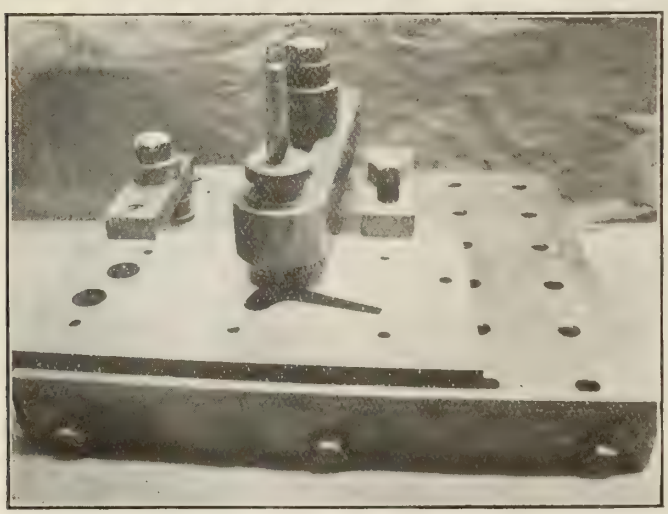
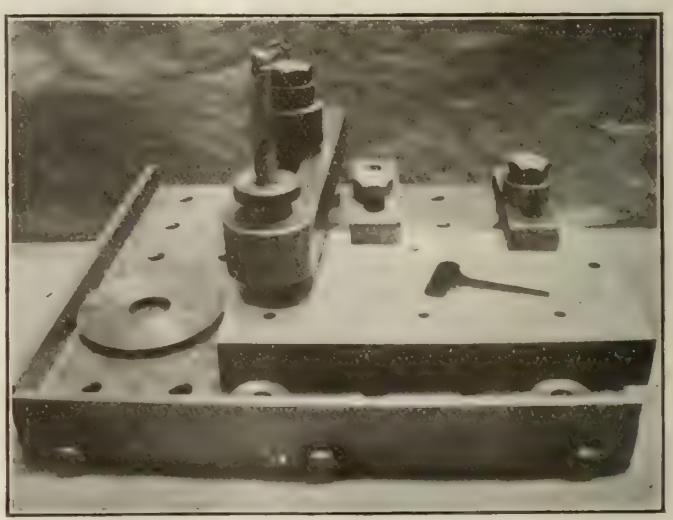




FIGS. 15 AND 16. FACE PLATE FOR SETTING OUT DRILL JIGS

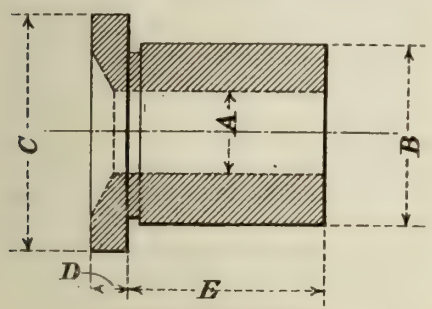
put into stores. With this little single-point boring-cutter it is quite an easy matter to bore the holes accurately to size and in the correct position. Suitable sizes adopted by the author are given in the following table:—

| Cast Steel up to 1 in. Diameter Outside | | | | Mild Steel Case-Hardened 1 in. and Upwards. | | | |
|---|---|---|---|---|---|---|---|
| A | *B | C | D | A | B | C | D |
| in. | in. | in. | in. | in. | in. | in. | in. |
| To 1/8 | 0.376 | 0 19/32 | 1/8 | To 0¾ | 1.0015 | 1 7/32 | 5/32 |
| " 3/16 | 0.4385 | 0 21/32 | 1/8 | " 0 13/16 | 1.127 | 1 11/32 | 5/32 |
| " ¼ | 0.501 | 0 23/32 | 1/8 | " 0⅞ | 1.1895 | 1 13/32 | 5/32 |
| " 5/16 | 0.5635 | 0 25/32 | 1/8 | " 0 15/16 | 1.252 | 1 15/32 | 5/32 |
| " ⅜ | 0.626 | 0 27/32 | 1/8 | " 1 | 1.314 | 1 17/32 | 5/32 |
| " 7/16 | 0.689 | 0 29/32 | 1/8 | " 1 1/16 | 1.4395 | 1 21/32 | 5/32 |
| " ½ | 0.7515 | 0 31/32 | 5/32 | " 1⅛ | 1.502 | 1 23/32 | 5/32 |
| " 9/16 | 0.814 | 1 1/32 | 5/32 | " 1 3/16 | 1.5645 | 1 25/32 | 3/16 |
| " ⅝ | 0.8765 | 1 3/32 | 5/32 | " 1¼ | 1.627 | 1 27/32 | ¼ |
| " 11/16 | 0.939 | 1 5/32 | 5/32 | " 1 5/16 | 1.6895 | 1 29/32 | ¼ |

*Where possible.

Note.—All drilling and locating liners from 0 to 1 in. outside diameter to be marked "Cast steel, Hd and Gd; not like this: "C.S.Hd and Gd;" over 1 in. to be marked "C.H.S.Gd."

With these means at one's disposal, the cost of producing drill-jigs and, in consequence, the number of pieces for which it is worth while to make them, is very considerably reduced. They make easy the setting of piece-prices for such



STANDARD BUSHES.

work, because the time required to produce the holes in any jig can be estimated very accurately. Foremen and operators soon gain confidence to set and accept prices.

## G. T. R. APPRENTICES' ANNUAL BANQUET.

THE tenth annual banquet of the apprentices in the motive power department of the Grand Trunk Railway System was held in the assembly of the company's shops at Stratford, Ont., on Thursday evening, March 18.

The gathering was the largest in the history of such functions, about 230 persons sitting down to the tables. The chairman, Robert Patterson, master mechanic, G. T. R. shops, Stratford, was flanked by the following: Mayor Barnsdale and H. W. Strudley, president of the Board of Trade, Stratford; J. Markey, master mechanic of the G. T. R. at Toronto; R. J. S. Weatherston, divisional freight agent; H. MacDougal, local freight agent; W. D. Robb, of Montreal, superintendent of motive power; W. M. O'Beirne, J. H. Gordon, A. M. Kay, Col. Wm. Lawrence; A. A. Maver, master mechanic of Montreal; Chas. McNair, Toronto; R. J. Leckie, London, and E. A. Meldrum.

An extensive toast list and musical program followed a most enjoyable supper catered by the Ladies' Auxiliary to the band, the orchestra of which furnished some delightful music during the repast.

### Robert Patterson.

Chairman Robert Patterson was geniality itself as he referred to the occasion, the tenth annual banquet of G. T. R. apprentices and to the pleasure it gave him to officiate for the tenth time as chairman of such an enjoyable function. It came as a fitting close to a season of study. The apprentices had arranged every detail in connection with the banquet themselves, doing the decorating of the hall, arranging for the program and various other incidentials all of which had gone to make the gathering of 1915 one long to be remembered, and the fact that apprentices were present from Chicago to Maine was an indication of the interest being taken in it.

### City of Stratford Toast

Mayor Barnsdale and H. W. Strudley, chairman of the Board of Trade, replied to the toast of the City of Stratford, which was taken after the toast to the King had been enthusiastically honored.

Mayor Barndale gave an interesting account of the early history of the G. T. R. in Stratford, commencing in 1870, when the shops were built, to be opened a year later. In 1875 or thereabouts a big sum was voted for the erection of a round house, and to the growth and prosperity of the city, since then, the mayor attributed the presence of the G. T. R.

H. W. Strudley took occasion to thank the apprentices on behalf of the Board of Trade of Stratford. As G. T. R. apprentices, he said, they had something in front of them. Our country was especially in need of technically trained men, and if all industries could work out an apprentice system like the G. T. R. there would be no dearth of trained employees.

**There were too many people tilling the farmers in the West, remarked Mr. Strudley, and not enough tilling the soil.**

### W. D. Robb.

In a happily worded address W. D. Robb, of Montreal, superintendent of motive power on the G. T. R. thanked the apprentices for the opportunity given him of being present at such a unique banquet—unique owing to the fact that the youngest employees of the system had invited its officials to sit and dine with them. This, in his opinion, was an indication of the boys' appreciation of what the officers were doing for them, while the perfect harmony existing between G. T. R. apprentices and the company was bringing the best of results, a fact greatly appreciated by the officials, particularly among those in the motive power department.

"The Grand Trunk Railway System," said Mr. Robb, "had made advancement equal to that of any road on the continent. It is meeting the requirements of the public better than ever before." The motive power, asserted Mr. Robb, was in especially good condition and G. T. R. engines, he believed, were equal to any in America. No advancement in the various departments of the G. T. R., however, had been as great as that made by their apprentice system in which a previously undreamt of perfection had already been achieved. The company now possessed six hundred apprentices at different points in the system where they were proving to be, or would prove to be, the biggest asset the G. T. R. possessed.

The success of the system, however, did not belong to any one man, the master mechanics and instructors being all responsible. The future of the motive power of the G. T. R. was well assured by the talent continually coming forward in the shape of trained apprentices.

Superintendent Robb thought the public should back up the Grand Trunk in its request for higher freight rates. This, in the face of a business depression which the G. T. R. was feeling like other concerns, was a just request. The G. T. R. was simply marking time with the general depression. Ninety of his engines had been laid up, waiting for work, and the effects had been greatly felt all over the line. "There are no better indications of prosperous times than a railroad's prosperity," said Mr. Robb, "so that throughout the United States and Canada business is slack when the railroads are slack and business is good when the railroads are prosperous."

### Motive Power Dept. Toast.

The toast to the Motive Power Department was responded to by A. A. Maver, of Montreal, master mechanic of the G. T. R. As a former Stratford resident he said he felt quite at ease, having pleasant memories of the city and its people. Going back reminiscently to 1888, over twenty-five years ago, when he first came to Stratford, Mr. Maver compared shop conditions of then and now. He thought the shops in Stratford were equal in design to any on the continent and, in closing, advised the apprentices to cultivate the habits of concentration and industry, to gain efficiency, the result being in promotion. "Second to none," he said, was the motto for the G. T. R. apprentices.

### Other Toasts.

An ex-apprentice, J. R. Lekie, of London, locomotive foreman, took up the response to the ex-apprentice toast, and R. Huegli replied to that of "Our Apprentices." The toast of "Our Visiting Apprentices" was replied to briefly by Messrs. Percy Smith, of the Montreal shops, John Atkinson, of Battle Creek, F. Davis of Ottawa, S. Pearson of Toronto, and F. B. McDonald of Port Huron.

### Our Soldier Boys.

Lieut.-Col. Wm. Lawrence and Pte. A. H. Janes of London camp, replied to the toast "Our Soldier Boys." Col. Lawrence referred to the good reports heard of the various contingents.

Private Jones, an ex-apprentice, expressed many patriotic sentiments and presented the thanks of his comrades, many of whom were present from London and also from Guelph, to Mr. Patterson for the occasion, closing with best wishes to the G. T. R. apprentices. A general expression of thanks to the Ladies' Auxiliary and others was included in a brief address by H. Thorne, secretary-treasurer of the apprentices' committee.

### Musical Program.

The musical program included solos by A. E. Dodds and Jas. O'Donoghue, who also scored a distinct hit with a clever make-up skit with some talented crayon work; an excellent cornet solo by W. Tonge, a good instrumental piece by Messrs. W. Plummer and J. Millman, ex-apprentices, and trombone selections by Messrs. F. Deakin and G. Bexton. The accompanist was Mr. W. Choyce, and R. Choyce led in the singing of Tipperary at the finish. The orchestra was composed of W. Choyce, W. Pieper, Jas. Malone, F. Deakin, G. Bexton and D. McLennan.

### The Committee.

The members of the apprentices' committee in charge of the banquet were: Messrs. A. Barnes, E. Davis, F. McDonald, W. Davis, G. Ewart, A. Dickson, W. Mitchell, G. Mavity, J. McArdle, W. Furey, A. Schaefer, A. McKenzie, R. Beadle, E. Townsend, and H. Thorne, secretary-treasurer.

### Soldiers Present.

The soldiers up for the occasion from London and Guelph included: Sergt.-Major A. Holmes, Corporal D. Innes and Privates A. H. Jones, G. Kerby, D. McIntosh, H. Polley, W. J. Lyon, W. Marks, H. Vivian, T. Flannigan, A. Reeves, C. Borthwick and R. Allen, all from London, and Signallers G. Hudson and G. J. Day and Private C. Clarke of Guelph.

## WELDING GALVANIZED AND TIN PLATES.

INQUIRIES are frequently made as to the possibility of obtaining satisfactory welds on plates or articles that have been galvanized or tinned. In most cases the welds obtained are excessively brittle, and in the case of welding galvanized material, the health of the welder is seriously affected by the fumes produced under the action of the blowpipe. It is therefore necessary for the welder to know the difficulties he has to contend with, and the methods to adopt in order to produce satisfactory welds on these materials.

### Galvanizing.

Zinc forms a cheap and excellent protective coating for iron and steel. It has the great advantage over tin and lead in being attacked in preference to the iron when the two metals in contact with each other are exposed to corrosion. For most articles zincing—or galvanizing, as it is wrongly called—is most cheaply and conveniently applied by dipping the iron or steel articles in a bath of molten zinc. Previous to dipping the articles are cleaned by acid and friction, coated with a flux of sal-ammoniac and heated. With certain articles this method has disadvantages; for example, in large objects, tanks for instance, it is difficult to heat the molten zinc evenly, besides the bath would have to contain many tons of zinc. In these cases, the depositing of the zinc electrically, known as electro-zincing, has marked advantages. The zinc is deposited cold, and does not alloy appreciably with the surface of the iron to be protected.

The application of oxy-acetylene welding to finished galvanized articles is the exception rather than the rule. There are cases where, owing to the distance from a galvanizing plant, articles are constructed from galvanized plates and oxy-acetylene is applied during the construction. In other cases, the blowpipe is frequently applied to correct defects of manufacture, for example, welded or riveted tanks which have failed under hydraulic test. Lastly, the blowpipe is an indispensable tool for the repair of galvanized articles.

### Galvanized Plate Welding.

In welding galvanized plates numerous precautions are necessary. The white jet of the blowpipe in contact with the plates produces abundant vapours and oxide fumes. These can interfere with the course of the work and, more important, seriously affect the health of the welder. Without proper preparation, the welds always include as impurities, zinc and slag, and the mechanical strength and soundness of the welds are directly dependent on the amount of such slag and zinc incorporated into the iron whilst molten.

The operation of hot galvanizing produces at the surface of the galvanized plate a layer of pure zinc and a series of intermediate alloys of iron and zinc, rich in zinc near the surface and rich in iron where the alloy comes in contact with the plate. As already indicated in describing the operation of cold galvanizing or electro-zincing, the zinc does not alloy appreciably with the surface of the iron. Under the action of the blowpipe the layer of zinc near the surface is volatilized, but this is not the case with the layer of alloy in contact with the iron or steel plate. Part of the alloy is dissolved in the iron, but the greater part forms a well-known earthy slag, and it is difficult to avoid its incorporation in the weld. The effect of including the zinc-iron alloy is to produce a very brittle weld, and the effect of incorporating the slag is to produce a defective weld with a consequent loss of strength.

### Zinc Removal Imperative.

It is obvious that to produce good, sound welds on galvanized articles, it is necessary to remove the zinc from the vicinity of the weld. The zinc should be entirely removed for a distance of 1 in. to 1½ in. on either side of the centre line of the weld. This preparation makes the cost of the weld higher, and many firms neglect this precaution. Where the strength of the joint is of small importance, the direct application of the blowpipe may be sufficient. In such cases the health of the workman should be considered, and a suitable respirator be provided together with a plentiful supply of milk as an antidote. The plates should be bevelled as soon as the thickness reaches ⅛ in., otherwise burning of the iron and lack of penetration are sure to result.

The welding rod should be of Swedish iron, of dimensions appropriate to the thickness to be welded, and the power of the blowpipe should be that given for the welding of iron and steel plates of

identical thickness, that is, the hourly consumption of acetylene should be 240 to 320 litres (8½ to 11 cubic feet) for every ⅛ in. thickness to be welded. The removal of the zinc in the vicinity of the weld also removes the protective covering and it is not usual to replace it by re-galvanizing. The superiority of zinc over other protecting metal coatings is important in this case as it is possible for the exposed iron to be protected by the surrounding zinc. It is advisable, however, to clean thoroughly the welded parts and paint them with a protecting paint having an aluminium base.

### Tin Plate Production.

Tin plates are sheets of iron coated with a very thin film of tin. The manufacture of tin plate consumes the larger part of the world's output of tin. The plates resist the corrosive action of salts and acids, and tinned articles are commonly met with in practice. The process consists in annealing, washing, pickling and rolling the plates to get a good surface, they are then coated with tallow or palm oil previous to dipping in a molten bath of tin. The tin readily alloys with the iron at the surface of contact, and a thin film of tin adheres to the alloy. Alloys of iron and tin, even when only traces of tin are present, are extremely brittle hot or cold.

### Tin Plate Welding.

In the oxy-acetylene welding of tin plates, the tin is not eliminated as a vapor or as oxide fumes as in the case of zinc. Although tin melts at a low temperature (450 deg. Cent.), its vaporizing point is in the neighborhood of the melting point of steel (2,790 deg. Fah.), and further, the tin does not separate from the iron, but is entirely absorbed by the iron as soon as the latter reaches red heat, so that when the iron becomes melted by the blowpipe the iron-tin alloy is added to the molten bath. The result is that the weld consists of very large crystals, which are separated by numerous fissures or cracks.

In endeavoring to weld tin plates without preparation, the welder observes cracks forming behind the blowpipe during the execution of the weld. These cracks are produced by the expansion and contraction strains. For ordinary welds on iron and steel plates, these strains are either negligible or easily overcome, but in the case of tin plates they are sufficient to break up the structure of the iron-tin alloy which is formed during the course of welding. It is, therefore, absolutely impossible to weld tin plates satisfactorily without first carefully removing the tin from the line of welding and its immediate vicinity in the manner indicated for the welding of galvanized plates. The instructions given for obtaining satisfactory welds on galvanized plates hold good for tin plates.—Acetylene Lighting and Welding Journal.

## COMPOSITION OF ENGINE CASTINGS.

THE standard composition of British engine castings is given by Frank Foster in his paper, entitled "Essential Principles of Engine Design," read before the Manchester (England) Association of Engineers:

| | Steam Cylinders | Frames | Flywheels | General |
|---|---|---|---|---|
| Total carbon, per cent. | 2.90 | 3.30 | 3.50 | 3.50 |
| Combined carbon, per cent. | 0.90 to 0.95 | .... | 0.37 | .... |
| Silicon, per cent. | 1.10 to 1.30 | 1.60 | 2.00 | 1.70 to 2.20 |
| Manganese, per cent. | 0.60 to 0.90 | 0.65 | 0.40 to 0.50 | 0.30 to 0.40 |
| Phosphorous, per cent. | 0.40 to 0.60 | 0.50 | 0.90 | 0.40 to 1.40 |
| Sulphur, per cent. | 0.15 | 0.15 | 0.15 | 0.15 |
| Transverse load, cwt. | 35 to 46 | 34 to 38 | 30 to 33 | 29 to 32 |
| Transverse deflection in inches | 0.50 | 0.50 | 0.35 to 0.45 | 0.30 to 0.50 |
| Tensile strength, tons per sq. in. | 12 to 14 | 11 to 13 | 11 to 14 | 9 to 11 |

## SEMI-STEEL.

AN interesting discussion on semi-steel took place recently at the Lancashire branch of the British Foundrymen's Association. Mr. Roe, in opening the discussion, mentioned a difficulty which arose when the metal had to be carried thirty or forty yards before pouring. The difficulty consisted of hard spots at the riser end. Mr. McLain, the American expert on semi-steel, had suggested manganese as a remedy, but the reason for the addition of manganese was not clear since the latter is usually considered as a hardening element. The proportion of steel scrap to be used in the mixture depends, of course, upon the purpose for which the casting is being made. T. Craig used a mixture of 3 of steel scrap, 3 of hematite iron, and 1 of Apedale No. 4 for casting a plate shear about 1 ft. in diameter. The resulting casting contains about 1 per cent. silicon, 0.9 per cent. manganese, 0.08 per cent. sulphur, and 0.5 per cent. phosphorus, corresponding practically to a cold blast iron, but costing very much less. He had used 15 per cent. of steel in a mixture for mild chilled roll. This was a roll casting in chills, but which shows no chill when the skin is broken.

The discussion, whilst of a very interesting nature, did not elicit any definite remedy for the hard spots described by Mr. Roe. It is probable that the most efficient method of dealing with this trouble is to reduce the amount of steel scrap or increase the silicon content of the pig-iron. Another curious feature which places a tax upon the metallurgist to explain is that the use of high carbon scrap, such as old files, has a remarkable tendency to produce hard spots, whereas by using mild steel scrap, such as boiler plate punchings, the trouble is very rare indeed. This fact is all the more remarkable, since it is known that the scrap must absorb a very considerable proportion of carbon from the cupola coke, before its melting point is lowered to within the range of temperature available in a foundry cupola.

## DECARBURIZATION IN SALT BATHS.

THE use of baths of molten alkaline salts for heating steel for hardening has now become general. They allow of the rapid heating of small parts of a uniform temperature and easy measurement of heat temperature. It is also generally believed that since the steel is not in contact with air during the heating superficial decarburization is avoided.

A. M. P. Portevin, in an interesting note on the subject to the last Iron and Steel Institute session, referred to experiments carried out with a steel containing 1.46 per cent. of carbon and with soft iron in a series of baths of different salts. Molten potassium chloride appreciably decarburizes steel at 900° C., and still more so as the temperature rises above this point. A mixture containing potassium chloride, sodium chloride, soda, potassium ferro-cyanide, described as Brayshaw's mixture (although Brayshaw disclaims the latter) was also shown to decarburize specimen badly.

An interesting feature was noted in the case of baths containing potassium chloride with an admixture of potassium cyanide. Samples of steel containing .78 per cent. carbon and Lancashire iron were treated simultaneously. Whilst the steel was decarburized, the iron was actually carburized from the bath. The action depends upon the cyanide admixture, the decarburizing action being almost constant, whilst beyond 25 per cent. of cyanide the carburizing action on iron decreases. The employment of cyanide of potassium requires careful investigation owing to decomposition which sets in if the bath is taken beyond a certain temperature, and owing to the possibility of introducing nitrogen into the steel.

**The Canadian Locomotive Company** of Kingston, Ont., has received an order to build two mogul engines for a contracting firm in Northern Ontario.

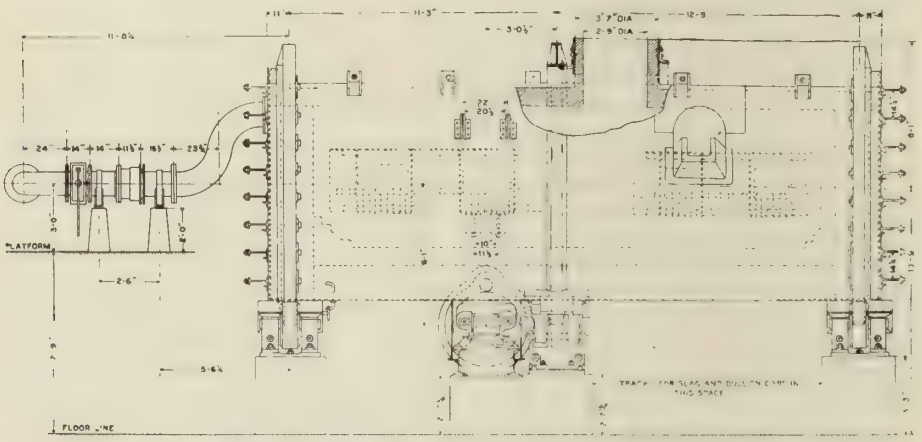
# Development of Our Nickel-Copper Smelting Industry

By A. W. G. Wilson *

*The accompanying article is the third of a monthly series descriptive of Canadian nickel-copper smelting plants. The European War has brought this particular industry very much into the limelight, on which account information relative thereto is of more than ordinary interest and moment. Section 3 of this description of the Mond Nickel Co. organization will deal with the Company's refining plant in Wales. Data and cuts are by courtesy of the Canadian Department of Mines and represent conditions existent in the fall of 1913.*

**MOND NICKEL CO.—II.**

A CONTINUATION of the description of the smelting plant at Coniston, Ont., in its various features, and a description of the Wabagishik hydro-electric power plant, also the property of the company, are the substance of this second and concluding article on the Mond Nickel organization in so far as its Canadian operations are concerned.



BASIC COPPER CONVERTER, PEIRCE-SMITH TYPE, MOND NICKEL CO. VERTICAL LONGITUDINAL SECTION (A.C. CO.).

The main flue is provided with 27 hoppers, placed at 7.5 ft. centres, in sets of two, between the main bents of the supporting structural steel work. There are also four large hoppers placed between the main flue and the brick dust chamber. The bottom of the dust chamber is fitted with 6 rows of steel hoppers, 9 to a row, the distance from centre to centre being 56 in.; each hopper is provided with a circular discharge gate 13 in. in diameter, closed by a lever-operated slide. The hopper chutes beneath the dust chamber deliver to a common space so arranged that the flue dust can be run into a V-shaped auxiliary hopper of sheet steel hanging above a standard gauge track in the slag cut. Six chutes deliver from this hopper to a car placed beneath.

Blowing Equipment. — In the power building are three Connersville blowers and two Nordbergs. The blowers at the Victoria Mines plant were transferred to the new plant and one new Connersville and one Nordberg were added.

Blast Furnaces.—There are two Allis-Chalmers rectangular water-jacketed copper blast furnaces, 50 in. x 240 in., each furnace being provided with a brick-lined steel crucible and a brick top above the single tier of jackets. The height of the furnace is 32 ft. 2½ in. to the base of the hood. The hood measures 12 ft. 6 in., giving a total height of 44 ft. 8½ in. A goose-neck, 7 ft. 6 in. in diameter, connects each furnace with the main flue, and a straight stack, closed by a damper, rises 15 feet above the hood.

Each furnace is carried on structural steel columns, the jackets being hung from I beams. The crucible rests on three rows of nine supporting columns each 5 feet in height. It consists of a rectangular steel frame about 6 feet in width, 21 ft. 9 in. in length, and 25 in. in depth, made of I beams; the sole plate is of cast-iron in four sections. This crucible box is lined with chrome brick around the sides, ends, and bottom, reducing the internal width to 4 ft. 2 in.

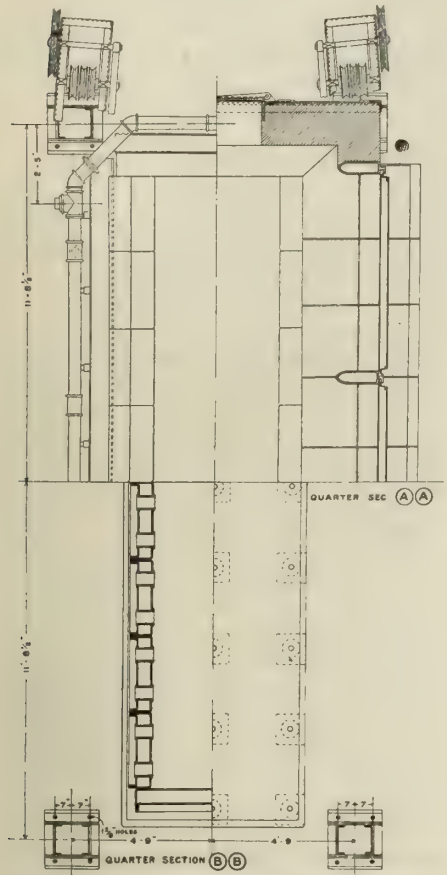
Above the crucible there is a single tier of water-jackets, eight on each side, each 8 ft. 2 in. in height. The width of the furnace is 4 ft. 2 in. at the tuyeres, and at the top of the water-jackets it is 5 ft. 9 in.

The throat of the furnace above the water-jackets is built of ordinary brick and lined with firebrick, forming a jacket 12 in. in thickness, the top being 3 ft. 7 in. below the charging floor. The space between the charging floor and the top of the brickwork is bridged by inclined apron plates. At the ends of the furnace the brickwork is carried to the top of the furnace, 8 feet above the charging floor. The charge doors along the sides of the furnace are operated by counter-weights. The settlers are about 15 feet in diameter. They are placed beside the furnaces and discharge matte and slag from opposite sides. The furnaces are placed

BLACKSMITH SHOP, MACHINE SHOP, ETC., CONISTON PLANT.

*Chief of Metal Mines Division, Ottawa.

parallel to the length of the building and may be charged from either side. Space has been provided for three, but only



COPPER BLAST FURNACE, 1912, MOND NICKEL CO. HORIZONTAL TRANSVERSE QUARTER SECTIONS (A. C. CO.).

two are being installed at the present time.

Converters.—The converters installed in the new plant are of the Pierce-Smith type of basic converter with shells 10 ft. in diameter, and 25 ft. 10 in. in length. Two have been installed in the building. The lining of each shell consists of 16 in. silica brick and 9 in. magnesite brick at the bottom, and 9 in. magnesite brick at the top. At the tuyeres, special 18-in. magnesite brick is employed. Each shell is provided with 30 tuyeres placed 14 on one side of the stack and 16 on the other, none coming directly below it.

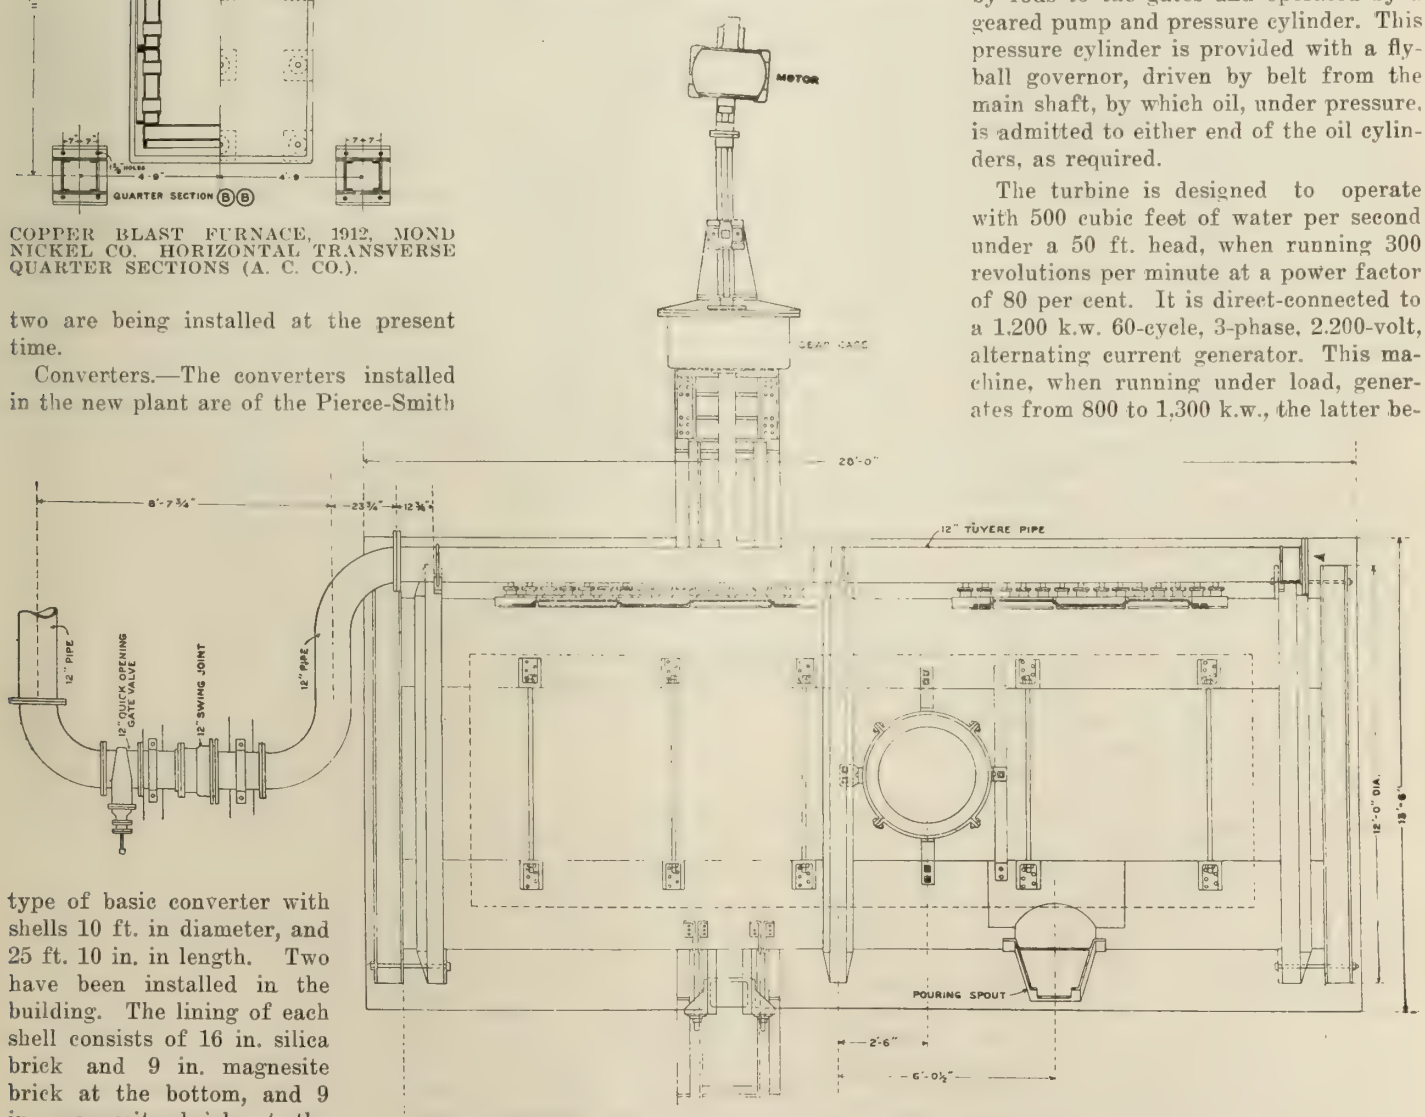
The blowing stack is 3 ft. 7 in. in diameter, but the lining reduces the free space to 2 ft. 9 in. It is placed near the median riding track, its centre being 11 ft. 2 in. from the end of the shell opposite the bustle pipe. The pouring spout is placed 7 ft. 7½ in. from the same end and about 77° of arc below the stack. The ends of the shell serve as annular tracks upon which it may be rotated, and a third riding track placed 7.5 in. to one side of the middle of the length of the shell has also been provided. The tracks rest on rollers carried on cast-iron bearing plates, bolted to a concrete foundation. The shells are turned by steel ropes pulled by a sliding gear operated by an electric motor and a worm screw, with an 8 ft. stroke. The converter floor is served by two 50-ton Whiting cranes.

### Wabagishik Power Plant.

The hydro-electric plant belonging to the company is located at Wabagishik falls, on the Vermilion river about 8.5 miles from Victoria Mines station on the Canadian Pacific Railway. The power-house is a concrete block structure, 46 ft. x 90 ft., and is equipped with an overhead travelling crane of sufficient capacity to lift the heaviest single piece of the turbine unit. The steel pipe-line leading from the dam to the power house is 450 feet in length, and 8 feet in diameter.

The main turbine is of the horizontal twin type, with a pair of cast-iron runners secured to the main shaft, all enclosed in a steel housing arranged so that the water enters parallel to the shaft, and discharges into a common draft-chest. The top part of the housing is made in removable sections to facilitate quick inspection of all internal parts. The regulating gates consist of two sets of movable guide vanes, operated between two rings moved by short links, and regulating rings that are connected to the regulating shafts by rods and levers. The machine is governed by an hydraulic cylinder with piston connected by rods to the gates and operated by a geared pump and pressure cylinder. This pressure cylinder is provided with a fly-ball governor, driven by belt from the main shaft, by which oil, under pressure, is admitted to either end of the oil cylinders, as required.

The turbine is designed to operate with 500 cubic feet of water per second under a 50 ft. head, when running 300 revolutions per minute at a power factor of 80 per cent. It is direct-connected to a 1,200 k.w. 60-cycle, 3-phase, 2,200-volt, alternating current generator. This machine, when running under load, generates from 800 to 1,300 k.w., the latter be-



BASIC COPPER CONVERTER, PEIRCE-SMITH TYPE, MOND NICKEL CO. HORIZONTAL LONGITUDINAL SECTION. (A. C. CO.).

ing the peak load when the mine hoist is suddenly thrown into action.

The exciter unit consists of one single horizontal-shaft turbine, mounted in a cast-iron casing, with regulating gate made up of guide vanes pivoted on pins between two heads, and operated by means of a split regulating ring on the front head, connected by links to the governor. The generator is direct connected to the shaft, and is a 60-k.w., 120-volt machine. It is designed to operate on 27 cubic feet of water per second, at 50 ft. head, when running 875 r.p.m.

The switchboard apparatus at this power plant consists of one panel for control of the exciter, one panel for control of the generator, and one line panel provided with 16,500 volt lightning arrester and accessories. The generator voltage is 2,200, and this is stepped up to 16,500 volts for transmission over the power lines. The transformer equipment at the power house consists of one bank of transformers (three) of 800 k.w. capacity each. Power is transmitted over a line of No. 6 copper wire.

The smelter sub-station was equipped with three 350 k.w. oil-insulated, water-cooled transformers, which stepped the power down from 15,000 to 600 volts.

The Victoria mine sub-station is equipped with three 200 k.w. transformers, 15,000 to 600 volts.

## NICKEL REFINING IN CANADA.

IN view of the fact that in another section of this issue there appears the second and concluding article on the Mond Nickel Co. plant at Coniston, Ont., and also that in next week's issue we will deal with the same concern's refining plant in Wales, the following extract from a contribution to the Toronto Globe will be found not only interesting but to some extent supplementary.

Much, says the author of the article, has been written of late on the nickel question, some of the statements made being fairly truthful, but a large proportion betraying either gross ignorance or a suspicious bias in favor of interested parties, yet it is doubtful if there is a conscientious metallurgist to-day that can advance any sound objection to the refining of nickel in Canada.

### The Lack of Raw Materials.

The lack of some necessary raw materials has been cited as an insuperable obstacle, but what these are is a mystery. If salt cake or any sodium compound be one of them, has not Canada unlimited quantities of common salt within her territory, as well as factories turning out alkaline products of various kinds? The installation of a nickel-refining plant would be a powerful stimulant to other industries that produce the materials it requires and, if the excess of by-products be considered a serious matter, let us remember that Canada is growing and developing every day.

Within the next twelve months there may be a market for double and treble the output of some of our factories, for one new industry begets many others. Hydrochloric acid has been mentioned as a by-product hard to dispose of in this country, and it may be advisable to point out here that the Hybinette refining process for nickel requires this article in large quantities.

Does any reasonable person fear that such a profitable business as the production of nickel will collapse if an export duty is placed on the matte or ore? It is far more probable that Canada will see within six months of the date of the order the most intensive job of plant construction ever performed in this country. There need be no fear of a monopoly, and by insisting on the refining of our nickel within the Empire we shall escape from the pitfalls of contraband law, a harassing event in war times, and such serious and complete financial disaster as has lately befallen the Australian zinc industry.

There is a strong and rapidly growing feeling prevailing throughout the Empire that we should no longer permit other nations to control the markets of products derived from the Empire's natural resources, and this is a matter that the next Imperial Conference should take cognizance of, formulating some plan that will be fair and satisfactory to all the Dominions and colonies. "Made-in-Canada" is a good cry, but "Empire-made" has a broader and more significant meaning, releasing us all as it will from the domination of the Guggenheims, Hirchs, Sondheimers and other foreign exploiters.

The writer himself has unlimited confidence in the future of Canada, with her almost illimitable prospects, and faith and co-operation are all we require to insure us that prominence in the commercial world to which we are justly entitled.

## HARD CASTINGS REMEDY QUERY.

WE have a home-made cupola, the shell of which belonged to an old steam boiler. The cupola is lined with firebrick, and has an inside diameter of 26 inches. There are four tuyeres of 4 in. x 4 in. section, and the blast is delivered through a 7-in. pipe from a Boston Blower Co. exhauster. We use Albany molding sand mixed with our own yellow sand, the latter of which old molders claim to be all right when so employed. We can melt any amount of iron, but our castings are very hard, so much so that considerable trouble is experienced when they come to be machined. Suggestions as to a remedy or remedies for this hardness are invited from readers of Canadian Machinery.—Allie Bros., Maniwaki.

## RUNNING COSTS OF MOTOR VEHICLES

IN the course of a paper on "Running Costs of Motor Vehicles," read before the Society of Engineers (Incorporated), on March 1, R. W. A. Brewer, the author stated that the problem before the automobile engineer was to transport persons and goods in a minimum of time and at a minimum cost. The second consideration was, perhaps, the more important, and could be profitably discussed from an engineering standpoint. The main heads under which expenses might be classified were (i) fuel cost and consumption, (ii) lubrication systems and consumption of fuel (iii) wear and maintenance, (iv) tires.

As regards fuel cost, it could not be said that a powerful engine was proportionately a greater fuel consumer than a similar one of less power, and the author discussed the factors producting economy in the use of fuel. The question of efficient lubrication was of the highest importance, but little progress had yet been made and further experiments were necessary. Piston friction also required more investigation, the most suitable form and material and the appropriate number of rings for a given type of car being yet undecided; attention was also directed to the problem of piston clearance. In valve mechanism there was little room for improvement, but the transmission losses had not yet been reduced to a minimum.

Gas friction caused loss due to the reduction of the volumetric efficiency of the engine, and efficient carburation played an important part in reducing loss from this cause, while changes of direction of flow should be made as easy as possible. At all diversions of the flow path, a sufficiently high wall temperature must be provided to prevent precipitation. It was not so much the quantity of heat as its application at the correct points that was of the highest importance.

The author criticized the usual method of conducting fuel consumption tests, and indicated the importance of using an accelerometer when making such tests. The variation of the power required to drive a car was due largely to wind and rolling resistances. Total car resistance was also influenced by the balance of the wheels, engine parts and propeller shafts.

# Machining Shrapnel Shell Parts, and the Tools Employed

By F. H. Mayoh

*Just as there is a wide distribution of orders for the machining of 18-pounder shrapnel shell parts, in like manner will there be more or less diversity in method and procedure adopted relative to their quality and quantity output as finished products. A thoroughly practical demonstration of how to achieve the desired end profitably is given in accompanying article.*

THE component parts of shrapnel shells are of course no less important than the case or body and are usually manufactured on a commercial

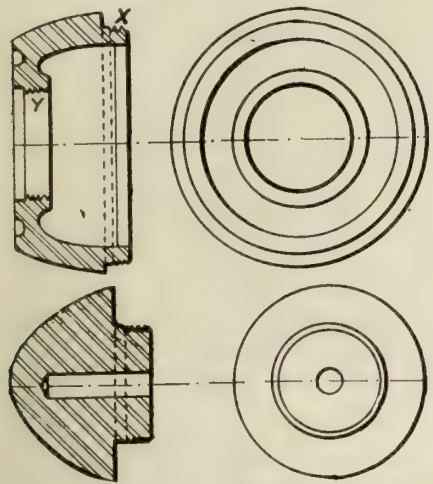


FIG. 1. UPPER—SHRAPNEL SHELL HEAD "A." LOWER—SHRAPNEL SHELL CAP "B."

basis by the use of special tools which make for rapid production.

The first of these component parts to be featured is known as the shrapnel shell head, a detail being shown at A, Fig. 1. This head has two threads cut on it, one outside X, where it is screwed into the case, and one internal thread Y, where the cap part of the shell is held. It is with this portion of the shell that the timing is done, and the operations when made from forged blanks as is usually the case unless the shells are small, consist of boring the threaded hole, forming the inside, turning the threaded end, facing the end, tapping the hole, threading the outside end, and forming the outside.

Handling these heads on a turret lathe of the automatic type, the first operation is shown by Fig. 2, with the tool set up which is used in this connection. Referring to the illustration, the piece is gripped over the outside at the large end by means of special jaws A in a three-jaw chuck, these jaws being bored out to conform to the shape of the work and scored or checked to enable them to secure a good grip.

In the hole of the first turret face, a drill B, is placed which is of the three or four lip type for opening up the hole. On the cross slide is mounted a tool C, which rough shapes the outside of the head and rough faces the end. The turret now indexes, and the hole to be threaded is bored with blade D, and counterbored with blade E, while a blade F, cuts a recess or groove in end. All of these tools are held in a piloted boring bar G, fixed in the hole of the turret. The tool H, on rear cross slide block finish faces the end. On the next indexing of the turret, the hole is tapped with tap in turret hole I. This completes the first operation on the head, and it will be noticed that the fourth turret face is left blank.

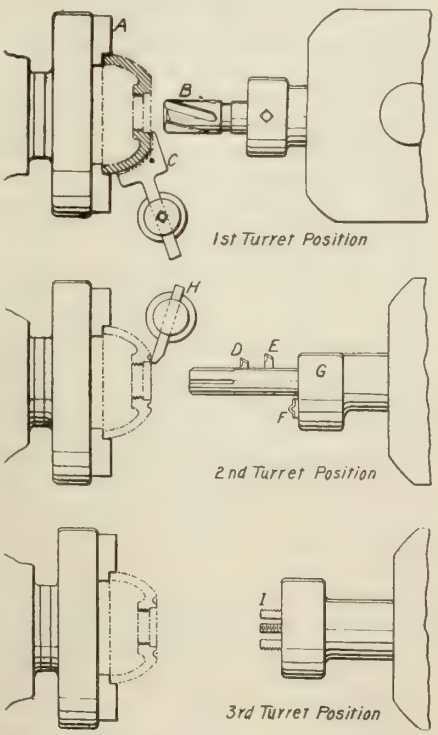

FIG. 2. FIRST OPERATION ON SHRAPNEL SHELL HEADS FROM FORGED BLANKS.

It quite often happens that when an extra turret face is available, what is known as a conveyor is placed in it, the latter being simply a sleeve held in the turret hole which is bored out to take the work being handled. As the turret is going through the cycle of cuts, the operator places the work in this sleeve and it is thus conveyed to the chuck at the proper time. These conveyors are employed on various classes of work, being varied to meet conditions. They

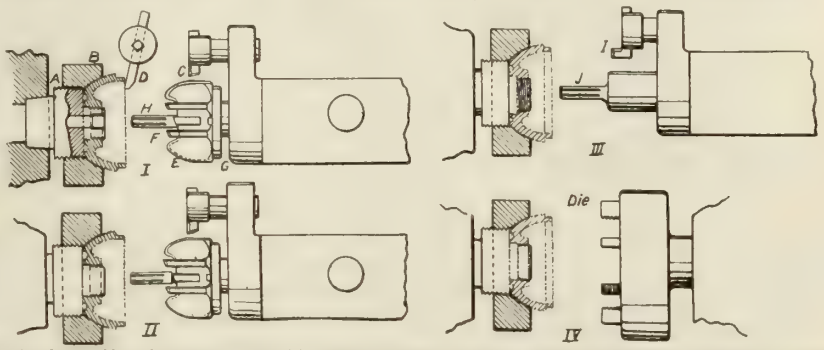

FIG. 3. SECOND OPERATION ON SHRAPNEL SHELL HEADS FROM FORGED BLANKS.

are mostly used with a lever chuck, a compressed air collet or device making the machine almost completely automatic. Conveyors answer the same purpose as a hopper or other automatic feed on a screw machine except that owing to the nature of the work, but one piece is placed in the holder at a time and this is done when it does not interfere with the operation of the machine.

The next step is to finish the inside of the shrapnel shell head, turn and thread the outside, face short hub and face end. This is acomplished by means of the tool set up shown by Fig. 3, and is followed by a third operation, Fig. 4, at which time the stock left around the outside curve is turned off with a single point tool.

Referring to Fig. 3, the head previously tapped and counterbored is placed on a threaded arbor, A, and run up to a shoulder with the counterbored end fitting the arbor to centralize the work. In this position the collar B is screwed back against the work, in the manner shown to brace it. We are now ready to take the cuts and proceed by first turret face, rough turn thread C, rough face end D, rough form inside with formed mill E, and rough face short hub with blade F in bar G, which holds formed mill and in turn is held by the turret. The turret now indexes, and we finish the same places that we previously roughed by similar tools held in similar fashion. It will be noticed in this connection that the bar which holds the

formed mill has a pilot H, which is a running fit in a bushing in the arbor, and holds the turret of the lathe rigid with the head stock, ensuring more accurate work. On the next turret face is held a blade I, for boring out the hole at the large end for a short distance, and this

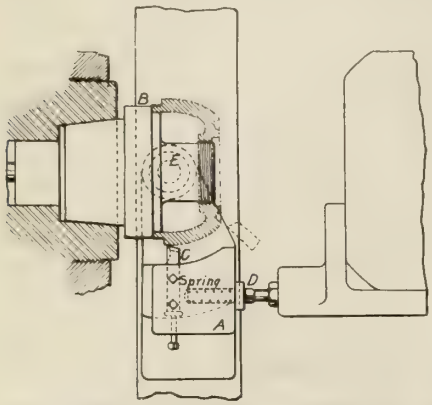

FIG. 4. THIRD AND FINAL OPERATION ON SHRAPNEL SHELL HEADS FROM FORGED BLANKS.

is known as size boring. A bar J, is also placed in the turret hole at this cut for the piloting purposes outlined above. Cutting the thread completes the operation and is done with a die on the fourth turret face.

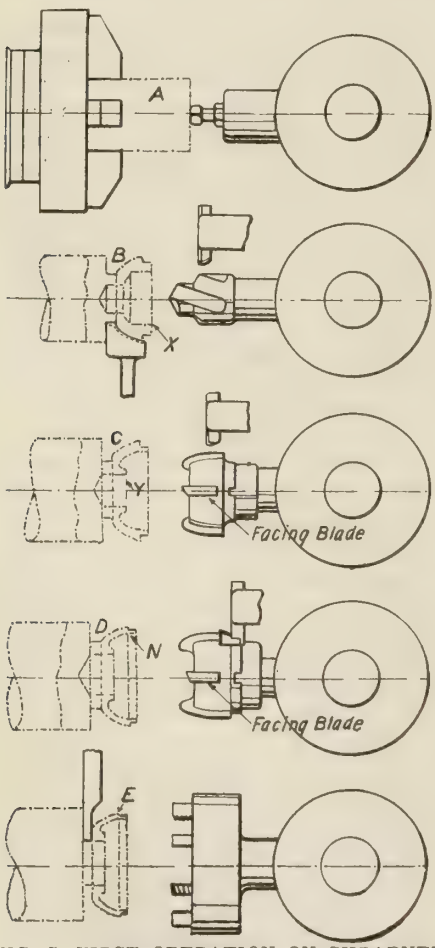

FIG. 5. FIRST OPERATION ON SHRAPNEL SHELL HEADS MADE FROM THE BAR.

By means of the swing tool A, Fig. 4, the third and final operation on these heads is performed in the following manner. The head is placed on an arbor B, fitting at the size bored end, and is screwed up by means of the thread at the small end of the head. When in position, the cross slide has been locked so that it cannot move either in or out, and the blade C is in the position shown by the dotted lines at start of cut. As the turret comes forward, a screw D, in a bracket bolted to the turret pushes the

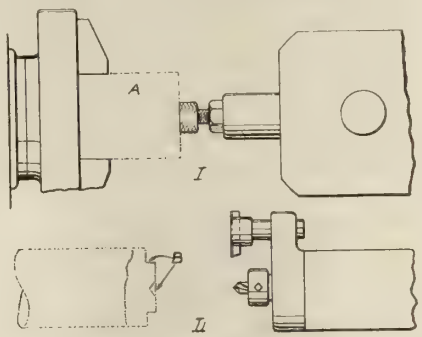

FIG. 6. FIRST OPERATION ON SHRAPNEL SHELL CAP.

upper part of the cross slide block, thus causing it to pivot on the stud E, and turn the arc. As the turret returns, a spring in the cross slide block forces the swing tool back to its original position at start of cut. In this operation, it is unnecessary to revolve the turret, as but one face is used (the one for pushing), so the turret is locked in position on the turret slide.

### Shell Heads From Bar.

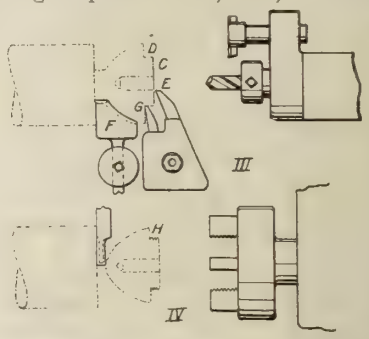
The manufacture of shrapnel shell heads from the bar is usually accomplished in two operations, on either a screw machine or turret lathe when the size is small enough to warrant this method, although there is no saving of time owing to the amount of metal it is necessary to remove, and an outline of these operations is given below.

The stock is fed against a stop and gripped by an automatic lever chuck as shown by A, Fig. 5. The bulk of the stock is removed or the piece roughed out by drilling the two holes, turning the end to be threaded and starting to cut off with a wide cutter which cuts out the blank to approximate shape, these cuts leaving the work supported in the chuck as shown at B, Fig. 5. At the same time that this is being done, the end X is faced by a blade on the cross slide. The next batch of tools on the third turret face and in the turret hole leave the work as shown at C, Fig. 5. The operations are rough form inside with formed mill, rough face short hub Y. The turret indexes, and the next batch of tools finish out inside, finish face short hub, finish turn for thread and size bore end Z, as shown at D. On the next face the thread is cut and piece cut off as shown at E, Fig. 5.

At the second tool set up or operation, the shrapnel shell head is reversed and placed on an arbor and has the hole to be tapped, bored and counterbored, the groove in the end cut, the end faced. The outside arc is then turned with tools similar to those for use on forged blanks thus completing the piece in two settings.

### Shell Cap.

It is customary to think of a shell as having a point on it, and, in the case



of shrapnel, this point takes the form of a cap which is shown as B in Fig. 1. The methods of manufacturing this cap

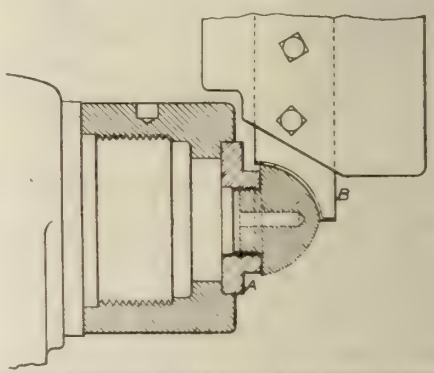


FIG. 7. SECOND OPERATION ON SHRAPNEL SHELL CAP.

is shown by Figs. 6 and 7, first and second operation respectively, these caps being usually made from the bar.

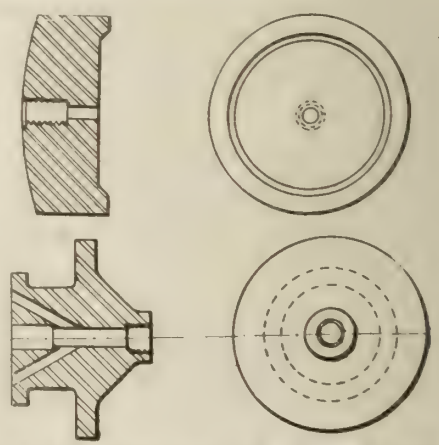

FIG. 8. UPPER—DISC "A" WHICH GOES NEAR POWDER POCKET. LOWER—PIECE "B" TO BE MADE FROM BAR AND DRILLED.

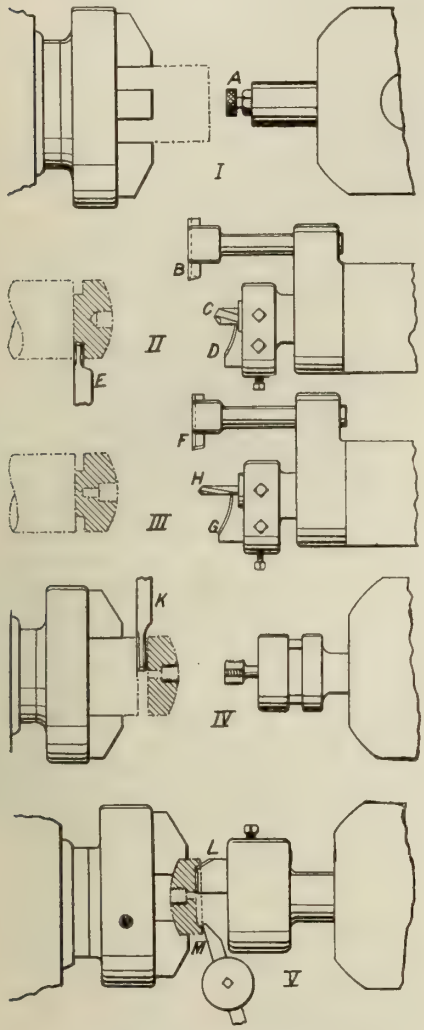
The first operation consists of feeding the stock against a stop on the first tur-

ret face A, Fig. 6, rough turning the place to be threaded, and spotting the hole to be drilled, B, with the second turret face; drilling the hole C, finish turning the place to be threaded D, and facing the end E, with the third turret



First T.F., Second Operation.

FIG. 9. METHOD OF MACHINING PART "A," FIG. 8.

face and the cross slide in the manner shown. At the same time, the formed blade F, roughs out the form of the cap, and a blade G, faces down the shoulder. The final cuts in this operation are cutting the thread H, with a die and cutting off the partly completed cap. By referring to Fig. 7, the final operations of screwing the cap into an arbor A, and, with a swing tool on the cross slide or a formed block B, the shape of the outside is finished to form.

Near the closed end of a shrapnel shell next to the pocket where the powder is placed for exploding the shell a disc is placed which holds the powder in place, and this is channeled out at the back and has an arc formed at the front to improve the action of the firing of the shells.

This piece is shown at A, Fig. 8, and is made from the bar in the following manner. The working is very simple but requires two operations to complete as follows:—Feed the stock against stop A, first turret face; rough turn outside B, drill hole to be tapped C, rough curve end D, and start to cut off E., all of the latter being carried on the second turret face and cross slide. On the third turret face, tools similar to the foregoing are used to finish turn the outside F, finish the curve G, and for drilling the small hole a drill H. is used which follows the point left by the larger drill preceding it. In the fourth turret hole a tap J, is placed for threading the large hole, while the partly finished blank is cut off by blade K. Reversing the piece now cut off, we grip it in a true running soft jaw chuck that has been bored out to receive the blank, form the recess L. and face end M. both operations being illustrated in Fig. 9.

At B, Fig. 8, another piece made from the bar is shown and as the general method of making this piece is along the same lines as those for making the previous pieces, no attempt will be made to give the tool details. The operations are feed to stop, drill large hole for thread, rough turn, hog out groove, rough form at end and start to cut off, leaving work as shown at A, Fig. 10. Next, drill small hole, face end and finish outside as mentioned above, leaving piece as at B, Fig. 10. Following this we tap C and then reverse the pieces to perform the next operation by gripping in a soft-jawed true-running chuck on the finished periphery while the end is faced, the small hole counter-bored and the outside, X, rough and finish turned.

In this piece it will be noticed that there are two small angular holes which must be drilled, and this is accomplished in the jig, Fig. 11, the work being slipped into a hole, A, in this jig and clamped by means of the swing-piece and screw, B. This holds the work, and the angular location is obtained by flatting off the sides, C, and having pilot bushing, D, to guide the drills into the correct position.

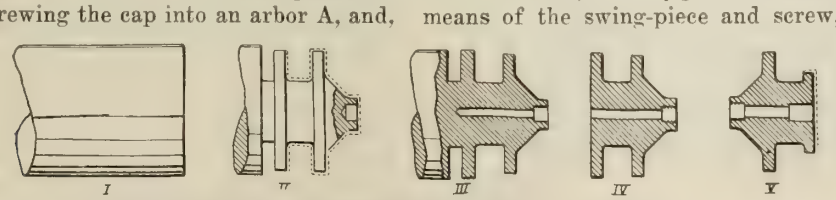


FIG. 10. METHOD OF MACHINING PART "B," FIG. 8.

I.—Blank at start of operation. II.—"A" after first cuts are taken. III.—"A" after finishing cuts are taken. IV.—Piece "C" tapped and cut off. V.—Piece reversed and final cuts taken.

The other parts of the shrapnel shell are easily made, the balls being made in large quantities by special apparatus and handled by the bushel.

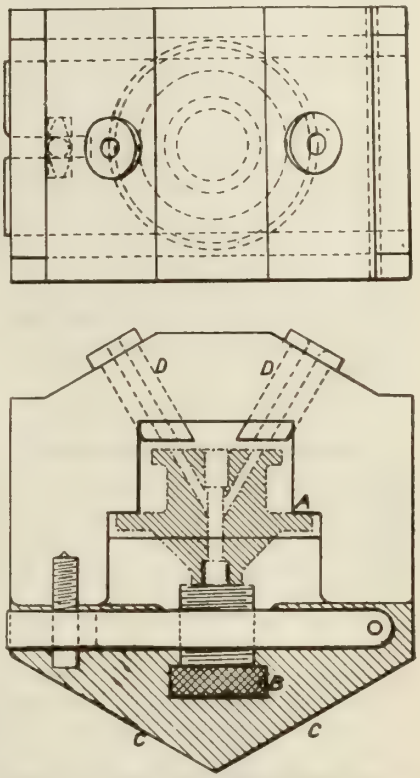

FIG. 11. DRILL JIG FOR TWO SMALL HOLES, PIECE "B," FIG. 8.

The tube is a screw machine product made from tubing which only needs to be threaded, cut off, reversed and the opposite end threaded, or, if a double

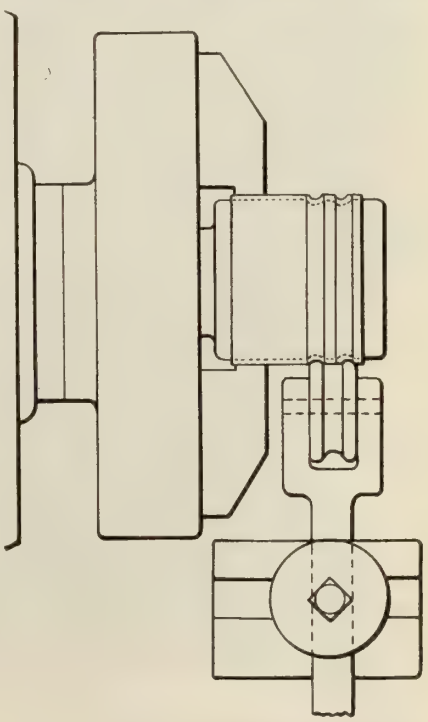

FIG. 12. METHOD OF SPINNING GROOVES ON SLEEVE.

head threading machine be available, they may be cut off, and then both ends threaded at the same time. The other small piece shaped like a cylinder is also a screw machine product and is made from the bar without turning. It has the ends rounded and is cut off.

The brass sleeve or hollow cylinder is made of tubing, cut off and placed on an arbor or held in the spindle of a lathe. It is gripped on the arbor by a soft-jawed chuck, and has the grooves spun around it.

The copper ring is usually made from tubing, bored and reamed. The outside is turned, the angles formed at the end and cut off, the whole being accomplished in one operation on a turret lathe or screw machine.

## GOVERNMENT FACTORIES.

BECAUSE scandals are reputed to have occurred in the fitting out of the first Canadian contingent with boots, blankets and what not, some of the advocates of government ownership of everything recommend, says the Montreal Gazette in an editorial, the establishment of Government factories for the production of all materials required by the public departments, from clothing for the militia to cars and rails for the Intercolonial; the theory being that in this way the country could save money and corruption be banished.

These persons have usually a great respect for the memory of Cobden, but have evidently not read the last speech he made in the British House of Commons, which was a violent yet seemingly well-founded attack on government factories. It is summed up in a book, "Cobden and Modern Political Opinions," written by his relative, the late Professor Thorold Rogers, an economist of repute, who adds some interesting remarks of his own.

### Government Factory Statistics.

A government factory can usually show that it is making goods cheaply because it seldom, if ever, takes account in its balance sheet of the public money invested in buildings and machinery, its estimate of the cost of production being based merely on the amount paid for labor and raw materials, the overhead charges being ignored. It was found in England, too, that the Government factory was not stimulative to invention and improvement. A private factory is quick to adopt new machines, and try new processes, strives to obtain the most skilful workmen, is economical and thrifty; in short, is conducted in a business-like manner.

On the other hand, the government workshops had no motive to improve for even if operated with stark inefficiency they received their annual appropriation regularly and carried on in the old groove, "building wooden ships long after wooden ships were exploded and producing munitions of war after patterns which the progress of science had antiquated long before." As there was no master's eye, the waste was prodigious, in some cases ludicrous.

Valuable materials were condemned and sold as old stores, the Government not infrequently buying them back at a greatly enhanced price. Certain projectors who had inventions or articles to sell dominated the factories while worthier ones were as good as excluded; and that wholesale grafting prevailed was notorious. So many people were interested in the maintenance of these abuses that when the cabinet of Lord Derby and Mr. Disraeli began the work of reform by closing the public workshops on the Thames there was a roar of protest.

We may take it for granted that much the same story would have to be told of public workshops in Canada. If any private contractor has been guilty of supplying defective or worthless goods to the soldiers, let him be punished to the full extent of the law; but we had better think twice before committing the Government to the business of manufacturing, for which it is not fitted.

## HIGH PRODUCTION DRILL PRESS.

THE College of Engineering of the University of Illinois has recently installed a high production drill press in its machine shop. This press is to be used in a series of tests on drilling in metals. The machine is of heavy construction, weighing 2,600 pounds, and has sufficient power to drive drills of high speed steel to their ultimate capacity.

At the highest rate of production, the machine forces drills through cast iron at the rate of 53 inches per minute, this being from three to five times the rate for ordinary drill presses, and almost equal to the rate of drilling wood a few years ago. The machine is of the all-geared type, no belts being used for power drive for any part of the machine. This geared drive eliminates the chance of slippage between motor and drill. All gears run in a bath of oil, and the machine is equipped with a circulating oil pump. The drive is by a 7½ horsepower motor.

A double wheel drill grinding machine has also been added to the equipment in the machine shop. This grinder has a wide range of adjustments, and makes possible the systematizing of drill grinding. With this grinder it will be possible to carry still further the noteworthy work of the Illinois shops in devising and using special tool charpening appliances.

## CALORISING.

A NEW process, called "calorising," or placing a protective coating on iron and steel and other metals, especially for use under high temperature conditions, has been worked out in the research laboratory of the General Electric Co., New York. According to the Iron and Coal Trades Review, "calorising," which is the discovery of T. Van Aller, consists in heating metals in revolving drums with mixtures containing, among other things, finely divided aluminum, so that a surface alloy containing aluminum is produced.

In the case of copper, this alloy is of the nature of an aluminum bronze, but richer in aluminum than the ordinary alloy of that name and more resistant to heat, so that copper thus treated is protected, up to the melting period of the alloy, from the scaling which occurs when untreated copper is heated above 300 deg. Cent. The same general result is obtained in the case of iron and steel.

Some use was made of this process for treating copper soldering irons and iron-resistance wires for heating devices. Pieces which, because of their shape or size, are not adapted for tumbling, may be calorised by packing them in, or painting them with, a suitable mixture and heating them. There are many places where it is desirable to use iron vessels or apparatus at temperatures above red heat, and at such temperatures ordinary iron rapidly oxidises and scales away. After iron is calorised, the effect of heating is slight.

**February Fire Loss.**—The losses by fire in the United States and Canada during the month of February, as compiled by the New York Journal of Commerce and Commercial Bulletin, aggregated $13,081,250, as compared with $20,060,600 in January, and $21,744,200 in February, 1914. The losses for the first two months of this year reached a total of $33,141,850, as compared with $44,948,900 for the same time in 1914. The following table gives a comparison of the losses for the first two months of this year with those of 1914 and 1913:

| | 1913 | 1914 | 1915 |
|---|---|---|---|
| January— | $20,193,250 | $23,204,700 | $20,060,600 |
| February— | 22,084,600 | 21,744,200 | 13,081,250 |
| Total 2 months— | $42,277,850 | $44,948,900 | $33,141,850 |

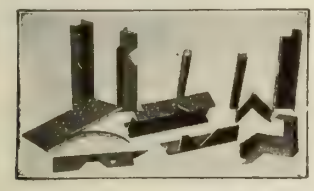
**F. H. Hopkins & Co.**, railway and contractors' supplies, Montreal, have been appointed sole Canadian selling agents for the contractors' hoisting engines, etc., built by the Napanee Iron Works, Napanee, Ont.

# PROGRESS IN NEW EQUIPMENT

## A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

### COMBINATION PUNCHING AND SHEARING MACHINE.

TO meet the demand for a universal combination machine among ornamental iron shops, as well as structural and car shops, that will handle punching, shearing and notching work without the necessity of interchanging attachments or of having to maintain a number of single machines for each operation, the Ryerson quin-



WORK SAMPLES.

tuple machine has been designed. It embodies five metal-working machines in one, handling the punching, shearing, coping and notching work on plates, bars, angles, tees, beams and channels, without the necessity of interchanging attachments for the various operations. Punch as well as bar cutter and splitting shear may be operated independently by automatic clutches which can be thrown in either by hand or foot. Work as illustrated can be done on this machine without change of tools, and cuts made are claimed to be perfect.

Plate Shear.—The frame of the machine consists of a solid steel offset shear body, which permits the cutting of plates of any width or length. A hold-down, which can be adjusted vertically and horizontally, is provided with the splitting shear.

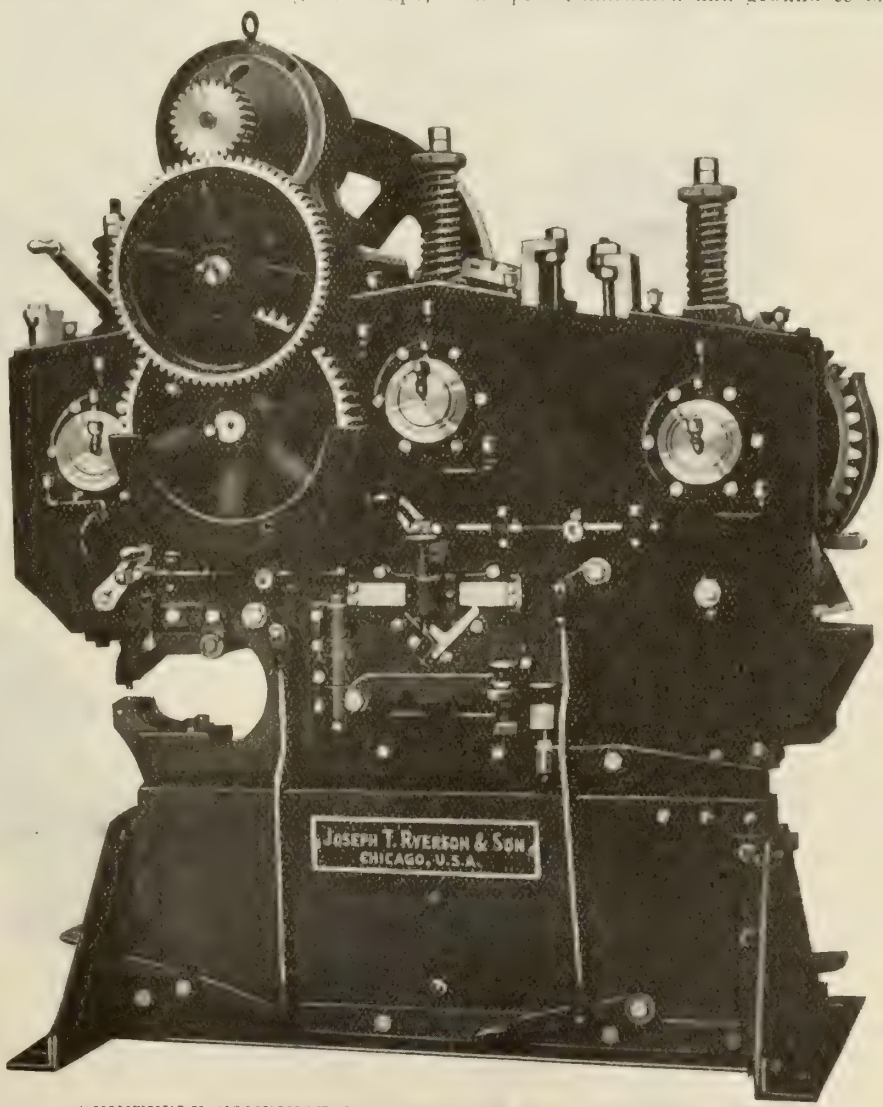
Bar and Angle Cutter.—By means of an improved arrangement of bar-cutting device, angles, tees, round and square bars can be cut without change of shear blades. The upper blade for shearing angles and tee bars is of right angle shape (no point or flat angle), which produces a clean cut without bending even the smallest and lightest sections. The shear blades are fastened to the slide in a simple manner, and are made in four pieces instead of one. Stationary blades are mounted in a hinged steel frame. This enables easy removal and grinding of any part of the shearing blades. The advantage of this construction as compared with the one-piece shear blade can be readily appreciated. Adjustable hold-downs permit the cutting of various material to a perfect right angle, and a special attachment furnished allows the cutting of angles in mitre up to 45 degrees.

Punching Machine.—All punches are equipped with standard architectural jaw, permitting the punching of I beams, channels and sections alike, in flange and web. A patented centering device is furnished with each machine, allowing the centering of punch to the full length of stroke of plunger. Universal hold-down takes care of stripping any material to be punched.

Coping and Notching Machine.—The sliding head of the splitting shear is provided with an extension to receive the die block for coping and notching work. This die block is of rectangular shape, permitting not only the standard coping of light I beams and channels, but also notching of angles, tees, Z bars and other material used in connection with stair, fire escape and ornamental work, etc.

General.—These combination machines are equipped with steel gears, cut teeth throughout, and can be furnished either for belt or motor drive. If direct electric drive is required, the machine is furnished with motor bracket, gear and rawhide pinion, and the motor is mounted on top of machine. With machine arranged for belt drive, tight and loose pulley and belt shifter, are supplied.

The sliding heads are made of crucible steel, finished all over and adjustable by means of bronze gibs. All plungers are counter-balanced by heavy coil springs. Shafts and eccentrics are forged out of one piece, machined and ground to size. Long bearings are provided for each shaft, bronze bushed, and ample provision is made for sufficient lubrication. All gears are well covered with cast



QUINTUPLE COMBINATION PUNCHING AND SHEARING MACHINE.

guards, so as to insure safety, and to conform to laws for the protection of workmen.

This quintuple combined punching and shearing machine is especially adapted for such shops as have not sufficient work to merit the extra expense of separate tools for the several operations.

These machines are made by Joseph T. Ryerson & Son, Chicago, Illinois, in four sizes, embracing in their plate shear feature thickness of plate from ⅜ in. to 1 in. The approximate weights vary from 3,000 lbs. in the smallest size to 25,000 lbs. in the largest, and each different size can be furnished in eight different combinations to fill special requirements.

## LINE OF TOOL HOLDERS

THE line of tool holders described and illustrated herewith are manufactured by J. H. Williams & Co., Brooklyn, N.Y., and embrace those for turning, boring, planing, cutting-off and side, knurling and threading operations.

We understand that unusual precaution has accompanied the development

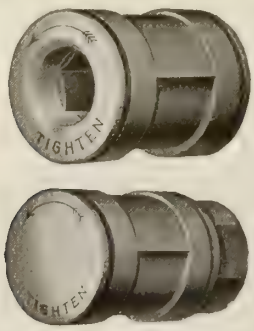


FIG. 1. FORMS OF LOCKING CAMS.

of this line of holders. Every detail has been tested and given closest possible attention. Materials best adapted to each of its parts have had every consideration and variety of test, and the design, with the thought of its fullest utility and non-obstructive character, has had abundant and purposeful care.

The holders or shanks, are all drop-forged from a strong, tough grade of carefully-selected steel, are submitted to a special heat-treatment or refining process, after forging, which develops resistance to wear, and gives the great strength necessary to overcome the pushing-thrust imposed upon the cutters. The cutter-holding channel provides an unusually strong seat for the cutter and great resisting qualities for the work imposed upon this portion of holder—a fundamental requirement in tool-holder efficiency.

The cam-fastening which features the turning, cutting-off and side and threading-tool holders is furnished from hardened and tempered crucible tool steel in either headless or hex head form. This simple and most efficient fastening largely eliminates trouble. It is practically indestructible, and removes thereby the repair and replacement necessities so common.

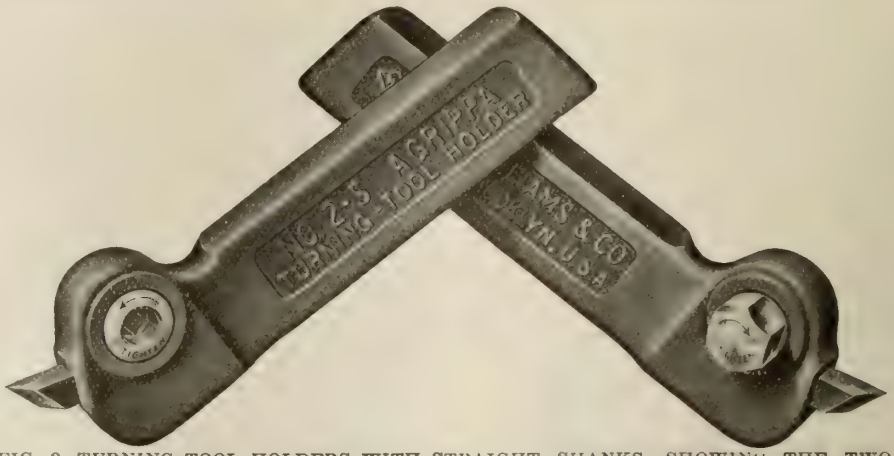

FIG. 2. TURNING TOOL HOLDERS WITH STRAIGHT SHANKS, SHOWING THE TWO TYPES OF CAMS.

The bar cutters are made from self-hardening and high speed steels of selected grade and are cut to the "diamond point" form or bevel. They thus provide for most common requirements with the minimum of grinding for either right or left-hand usage, as well as the full extent of economical service that may be demanded of a superior toolholder. Those who have had experience in the use of tool-holders in which the cutter is held in place by a set-screw know that trouble is frequently due to the breaking of the screw.

When this happens, it is a difficult matter to remove the broken part of the screw from the holder, because the screw is bearing against the cutter and the back pressure locks it in the thread. An investigation of workmen's time cards in many shops has shown that it is not an uncommon occurrence for a man to spend more time on the removal of a broken set-screw than the entire tool-holder is worth. Furthermore, it is often found necessary to anneal the screw in order to drill it out, and when this is done the metal in the tool-holder is likely to be damaged.

### Locking Cams.

With the view to overcoming the difficulties resulting from the use of set-screws, a carefully designed form of locking cam made of hardened and tempered tool steel has been substituted. These locking cams have a very gradual rise so that an extremely powerful grip is obtained through the application of a moderate pressure on the wrench with which the cam is turned. These cams are made in two forms as shown in Fig. 1, one of which is provided with a hexagonal head so that it may be turned with the special wrench provided for that purpose or with any other wrench that will fit. The second form of cam has a hexagonal socket and is turned by the same kind of key wrench that is used on the well-known hollow safety set-screws. The cams with the hexagonal head are of the standard form, but the cam with the socket is provided for cases where there is not sufficient clearance to admit the head of the cam, an example being the

FIG. 3. CUT-OFF AND SIDE TOOL HOLDERS WITH RIGHT AND LEFT-HAND OFFSET SHANKS.

turning of small crank-pins and facing the cheeks of the cranks.

The two forms of cams are interchangeable in the same holder. Only about 1-12 of a turn is necessary to

tighten the cutter in the holder or release it, so it will be evident that the operation is quite rapid. Full freedom of operation is obtained without removing the holder from the toolpost. With the idea of determining the relative strength of the grip obtained with the Williams cam fastening and with the commonly used set-screw, tests were conducted by mounting tool-holders provided with ¼-inch cutters held by the two forms of fastenings in a fixture mounted on a Riehle testing machine and applying pressure to the point of the cutter. It was found that the cutter held by a set-screw could be moved by the application of a pressure of 2,400 pounds, while the cutter held by a cam required the application of 4,200 pounds pressure to move it.

### Turning Tool Holders.

Fig. 2 shows the Williams turning tools provided with the two forms of cams and with straight shank holders. Turning tools of this type are also made with both right-hand and left-hand off-set shanks. The holders with straight shanks are made in seven different sizes with capacities for square cutters ranging from ¼ to ¾ inch in size; and the holders with off-set shanks are made in six different sizes with capacities for square cutters from ¼ to ⅝ inch.

### Cutting-off and Side Tool Holders.

Fig. 3 shows a combination tool-holder for cutting-off tools and side-tools. It will be seen that the broad edge of both the cut-off and the side-tool cutters are at the top. In the case of the cut-off tool this is necessary to provide the required clearance; and in both cases, having the broad edge of the cutter at the top provides more metal behind the cutting point for the purpose of conducting away the heat generated by the cut as rapidly as possible to avoid damaging the cutter. These tool-holders are made with straight shanks with the cutter on the right-hand side, and with right- and left-hand off-set shanks. Both styles of holders are made in five different sizes with capacities for cut-off tools ranging from 3-32 by ⅝ inch up to 3-16 by 1⅛ inch in size; and for side-tools ranging from 5-32 by ⅝ inch up to ⅜ by 1⅛ inch.

### Boring Tool Holders.

The distinctive features of the new Williams boring-tool holder are that the same holder can be used for all sizes of boring-bars which come within its range without requiring the use of bushings or shims; and that the cutter can be supported in the sleeve bar in a straight or angular position without requiring the use of more than one cap. Reference to Fig. 4 will make these features clear. The shank is provided with a shoulder in which there is a groove which receives the boring-bar, the bar being held in place by a cap and two screws. The larger sizes of bars are held as shown in the illustration, but when the bar is so small that the cap contacts with the holder, the cap must be removed and replaced in the reverse position so that the slot in the top engages the bar.

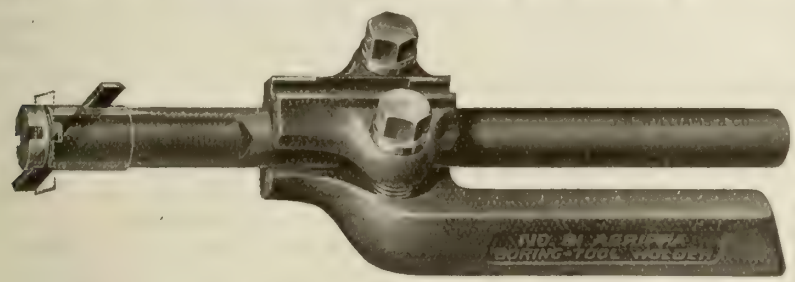

FIG. 4. BORING TOOL HOLDER SHOWING CUTTER IN STRAIGHT AND ANGULAR POSITIONS.

Fig. 4 shows clearly the way in which the cutter may be held in the bar in either a straight position or at an angle, while reference to the illustration will also show that there is a tapped hole in the end of the bar, which receives the clamping bolt. This bolt has two holes through it to accommodate the cutter in either of the two positions in which it is used. A sleeve with corresponding holes abuts against the end of the bar and the cutter is slipped through these holes in the sleeve and clamp bolt, after which the bolt is tightened to secure the cutter in place.

FIG. 5. KNURLING TOOL HOLDER PROVIDED WITH COARSE, MEDIUM, AND FINE KNURLS.

These boring-bars are made in four sizes with capacities for all sizes of bars ranging from 3-16 inch in diameter to 1⅛ inch in diameter. This tool-holder holds either round, hexagonal or octagon bars with an equally efficient grip, the clamp securing a four-point contact on bars of any of these shapes. A plain solid bar with straight and angular cutters at opposite ends is also provided for use in connection with these holders.

### Knurling Tool Holder.

Fig. 5 shows the Williams knurling tool which is fitted with three pairs of knurls carried in a revolving head. These knurls provide for handling coarse, medium and fine work, and any set of these knurls may be instantly brought into the operating position by revolving the head. It will be seen that there is a hole in the side of the holder for the purpose of enabling the pins to be driven out when it is desired to put new knurls in the holder. The knurls and the pins on which they revolve are made of carefully heat-treated tool steel. The size of the shank of this holder is ½ by 1⅛ inch by 6⅝ inches, and the size of the standard knurls is 3-16 by ¾ inch.

FIG. 6. THREADING TOOL HOLDER WITH LOCKABLE SPRING HEAD.

### Threaded Tool Holder.

The distinctive feature of the threading tool-holder shown in Fig. 6 is the provision of a lockable spring head which provides a solid head for the hold-

er when used for taking heavy roughing cuts, after which the lock may be loosened to provide for taking the finishing cut. The lock by which this result is secured consists of a bolt, the head and nut of which have an annular V-groove cut on the inside. These grooves fit over coresponding V-bearings on the holder, and, when the bolt is tightened, it locks the spring head of the holder so that it is perfectly rigid.

When it is desired to use the holder as a spring tool for finishing operations, it is merely necessary to loosen the bolt through part of a turn. The cutter is held in place by the form of locking cam already described. This tool is adapted for all classes of threading operations from the coarsest to the finest, and its lockable spring head is also especially well adapted for other classes of lathe work. These holders are made in three sizes with capacities for square cutters, ¼, 5-16 and ⅜ inch in size, respectively.

### Planing Tool Holders.

Two noteworthy advantages are secured by the use of a separate serrated adjustment ring in connection with the planing-tool holder. First, the serrated ring provides twenty-eight positions in which the cutter may be set, so that any desired adjustment may be obtained without the necessity of grinding the tool. Second, the ring may be made sufficiently hard so that the pressure of the cut will not result in the cutter wearing down its bearing and the entire holder becomes worthless. The use of a separate ring allows the remainder of the holder to be left soft so that it possesses the necessary strength to resist the intermittent strains which would be likely to result in breaking the holder at the neck, if the entire shank were hardened to provide the necessary durability for the cutter bearing.

Another feature is that the serrated adjustment ring makes it only necessary to turn the nut on the locking bolt through a half turn in order to loosen it sufficiently to adjust the position of the cutter. Reference to Fig. 7 will show that the washer under the nut on the locking bolt is provided with a spherical bearing on its under side. This permits the bolt to adjust its position to compensate for the strain of the cut without any tendency to bend the bolt and introduce transverse stresses in it. Either square or rectangular cutters may be used. In addition to its use for planing, this tool is especially adapted for use on the heavier classes of lathe work—particularly those where off-set tools are required. The holder is made in six different sizes with capacities for cutters ranging from 5-16 by 7-16 inch up to ⅞ by 1⅛ inch in size.

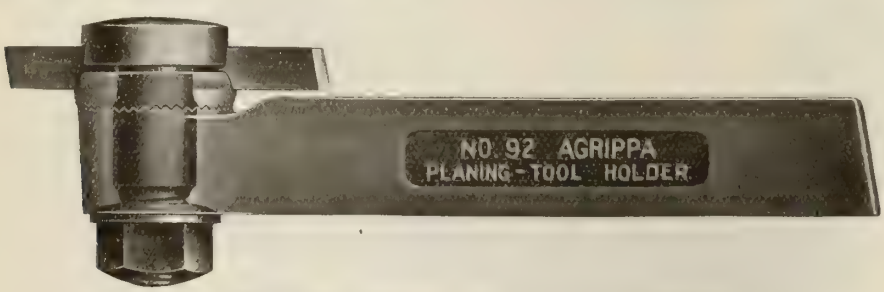

FIG. 7. PLANING TOOL HOLDER WITH SERRATED WASHER.

FIG. 8. BOLT FASTENING PARTS AND SERRATED ADJUSTMENT RING.

Fig. 8 shows the bolt fastening parts together with the serrated adjustment ring.

## EQUIPMENT FOR AUSTRALIAN RAILWAYS.

THE Department of Trade and Commerce, Ottawa, has received from D. H. Ross, Trade Commissioner at Melbourne, copies of twenty-one standard specifications of materials used by the Western Australian Government Tender Board. These specifications for the most part cover supplies required by the Railway Department, and embrace the following materials:—

Specification.
No. Material.
212—Steel axle forgings.
211—Steel blooms.

21M—Galvanized stay wire.

The specifications have been forwarded to the department to be retained permanently for the information of tenders, and the secretary of the Tender Board has arranged to furnish the department with a copy of the tender form for any supplies required. With this, and by means of the standard specifications referred to above, Canadian manufacturers will be afforded an opportunity of tendering for the oveasea requirements of Western Australia. The majority of the tenders are called simultaneously at Perth and London, and are usually returnable seven weeks from the date of calling. The department will be advised of the date of closing when the tender forms are forwarded. Interested Canadian manufacturers may inspect the standard specifications, particulars of which are given above, on application to the Department of Trade and Commerce, Ottawa. (Refer file No. A 1435.)

**Made in St. John, N.B. Display.**—An unusually interesting display was made this week in the hardware store of T. McAvity & Sons, in King Street. Much has been said and written in favor of the "Made-in-Canada" movement, and the slogan has become universal throughout the Dominion, but this was a "Made-in-St.-John" display, and it presented an appeal of much patriotic and civic interest. The display consisted entirely of articles produced in the company's big workshops and factory here, and filled several windows.

In one window was shown a variety of iron body globe and gate valves; another displayed ship pumps of different kinds; in another as seen an exhibit of locomotive mountings; while still another contained an extensive display of brass finishings. Besides these, there were many other articles giving an idea of the diversity of products manufactured by the local concern which has a market throughout all parts of Canada and many other quarters of the world.

## THE EMBARGO ON SHELL PRODUCTION KNOWLEDGE.

THE big row in Europe seems to have made everybody more or less querulous and ready to clutch at the slightest pretext for its full and free exercise. Such a condition of being cannot be termed in any sense unnatural, for it is but another way of expressing our selfishness, and of course we are naturally and oftentimes by careful cultivation quite selfish. We all hold in very high estimation what we choose to call our rights, whether as individuals, as a community or as a nation. We very often also hold a highly exaggerated estimation of what constitutes these rights, and more often than otherwise it is in their defence or maintenance that we fall foul of one another.

Respect for the rights of neutrals on the part of the belligerent nations is an issue that is breeding much heartburning meantime. The placing of orders for steel rails with a Canadian mill by an American railroad has also aroused much hostile criticism on the part of the business interests concerned in that country, and the loss of opportunity to let contracts and disburse money on a scale unprecedented in our national history, for which the particular party in power happened to be in line, is without doubt keenly felt and causes many heartaches to those of the other side.

Yes, in spite of the awful carnage, the gigantic scale destruction of property, the hideous maltreatment of human beings like ourselves, the general disruption of civilization and international business intercourse, instead of our being subdued to any extent, much less to an appreciable extent, we are fault-finding to the extreme.

Querulousness and fault-finding is epidemic, and to be out of fashion means being out of business, and being out of business is not far removed from being a nonentity. We, even on choice, might be disposed to adopt the querulous attitude for the reason given, however, like honors with respect to some people, it has been thrust upon us, and our personal "growl" is not so much against being muzzled as being discriminated against.

The usual freedom of our workshops and factories has been forbidden us, yet our contemporaries across the line have had full and free access, and let us say right here that the full noon-day glare enterprise that they have shown will not be without its helpful effect and of wider and more far-reaching nature than perhaps Canadian journalistic effort could have achieved, in accelerating munitions of war production on behalf of the Allies.

As already remarked, the advantage is all on the side of the political party in power when a big spending "Bee" is proceeding, and possibly we might allege also that the advantage is entirely with neutrals when it comes to describing the manufacture of munitions of war in a technical journal. Thousands of dollars worth of American-made machinery has been imported into Canada during recent months and who shall say that we are yet far away from the preliminary stage. "Necessity knows no slogan," and our Empire patriotism such that occasion for quibbling there is none.

We assume that there is very little, if any, of the usual business competition in this shrapnel shell manufacture. As far as we can learn, no concern desirous of engaging in it will be turned down. Many firms, however, would like to know something of the various operations and processes before taking the plunge, and others again would welcome information relative to more successful accomplishment. Ordinary business competition as we said already does not enter into the work, and in addition to the profitable output feature the widespread distribution of which in these trade depression times is so desirable, isn't there a patriotic flavor to the disposition to let the other fellow know how to make good?

The information as to how to manufacture profitably first quality shrapnel shells by every possible, known and practical method and through the medium of every type machine tool and attachment should be, and should have been long ere this, imparted to our factory staffs and mechanics, and while the embargo has so far prevented us bearing a part except in a rather indirect way, we feel that neutral journalistic enterprise has paved the way to lift the embargo placed on their belligerent brethren and made appreciably imminent some such condition as we have sought to contend for.

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

Toronto, Ont., March 23.—General trade conditions continue to improve and a more optimistic spirit keeps prevalent in business circles. In normal times this would naturally be expected at this particular season of the year. It is therefore satisfactory to note that, considering abnormal conditions, a revival is taking place this spring, although not to the same extent as in former years. The increasing volume of trade is largely due to the orders for military equipment and supplies, although the necessity for replenishing depleted stocks is also partly responsible.

The scarcity of tonnage is seriously affecting the export trade and steps are being taken to relieve the situation as far as is possible, under the circumstances. Ocean freight rates have advanced considerably, which is also causing much concern among merchants. The trade returns for February make a favorable showing although there was a considerable decrease in trade for the fiscal year just closed. It is satisfactory to note that the exports for February were nearly double those for the corresponding month last year.

### Steel Market.

There has been a little improvement in the steel market although business is considerably under normal. The build-

ing trade continues very quiet and manufacturing interests are, in many cases, far from busy. The demand for steel for shells is increasing and those plants making the forgings, etc., are very active. A number of specifications for steel bridges have been sent out and consequently there will be a better demand for structural shapes. The large order for steel rails recently taken by the Algoma Steel Co. from the Illinois Central Railroad has aroused considerable interest. While this will have a beneficial effect of keeping the company's rail mill busy it has established a precedent for low prices, and it remains to be seen what effect this will have on future business. It is, however, a credit to the company that they are able to produce rails at such a low figure and at the same time, of such high quality.

Prices have advanced on Pittsburgh steel bars, beams and angles for immediate delivery, and the new quotation is $1.15. All brands of galvanized sheets are higher due to the increased cost of spelter. Galvanized pipe has also advanced on account of the spelter situation; the new discounts are given in the selected market quotations.

### Pig Iron.

There is no change in the pig iron situation, business continues dull and in small tonnages.

### Machine Tools.

The improvement noted last week has been maintained the orders being almost entirely for shell machinery. Preparations are being made for working on lyddite and the larger type shells; engine lathes and drills being mostly in demand. Some of the contracts for machine tools for the new Technical School have been awarded, details being given in the Industrial News Section. It is interesting to note that a number of the tools will be built in Canada.

### Supplies.

The demand for machine shop supplies is steadily improving and is better than it has been for some time. There are few price changes to note this week, the most important being linseed oil, which has jumped to 84c per gallon, representing an advance of 12c. This sharp advance is due to the high price of flaxseed. Turpentine has advanced 1c and is now firm at 69c per gallon. Price lists of brass goods are still withdrawn, but the revised prices may be issued any time. Leather belting is firm but unchanged.

### Metals.

The demand is improving, but buying is still of a hand-to-mouth order. Conditions are still under normal and the high prices are entirely due to outside influences. The primary markets continue to show strength although there was a break in the tin market in London last Thursday. It has, however, recovered and is again advancing.

**Copper.**—The general tone of the copper market is strong and the situation unchanged. The demand from Europe continues very heavy. Lake copper is quoted at 16¾c per pound.

**Tin.**—The British Government has placed an embargo on the export of tin, with the result that considerable excitement has been created in the London market. There was a sharp break there last Thursday. The market, however, soon recovered and quotations have again advanced 4c. A shortage of spot tin is being felt and the market is unsettled. Prices are more or less nominal at 60c per pound.

**Spelter.**—The market is quieter but very firm. The general situation is unchanged and supplies are still difficult to obtain. Local quotations are nominal and unchanged at 15c per pound.

**Lead.**—The market is quiet but firm on the expectation of higher prices. Lead is quoted at 5¾c per pound.

**Antimony.**—The market is very firm and an advance is anticipated. English brands are scarce and prices are nominal. Antimony is quoted at 25c per pound.

**Aluminum** is unchanged at 23½c per pound.

## CANADIAN RAILROAD STATISTICS.

CANADA has given cash aid to railways to the amount of $233,772,640, according to the report of J. L. Payne, Comptroller of Statistics, just issued. Of this amount, $178,834,529 was contributed by the Dominion, $37,023,275 by the provinces, and $17,914,836 by municipalities. The cash aid to railways last year was $16,106,319, of which the Dominion gave $15,106,319.

### Land Grants.

Land grants up to 30th June last were as follows:

| | Acres. |
|---|---|
| By the Dominion | 31,864,074 |
| Province of Quebec | 1,198,650 |
| Province of British Columbia | 8,119,221 |
| Province of New Brunswick. | 1,647,772 |
| Province of Nova Scotia | 160,000 |
| Province of Ontario | 624,232 |
| Total | 43,613,949 |

### Earnings Dropped.

The gross earnings in 1913 were $13,619,164 less than they were in 1914, when they amounted to $243,083,539, the decline being equal to 5.6 per cent. The gross earnings in 1884 were $33,421,705; in 1894, $49,552,528, and in 1904, $100,219,436.

### Sources of Earnings.

The sources of gross earnings last year were as follows:

| | |
|---|---|
| Passengers | $62,012,296 |
| Mails | 2,500,176 |
| Express | 6,444,214 |
| Baggage, parlor cars, etc. | 1,607,517 |
| Freight | 165,753,731 |
| Station and train privileges. | 1,044,737 |
| Telegraphs, rents, etc. | 3,720,868 |

The gross earnings per mile were $7,893.60, a loss of $856.90, as compared with 1913, but it should be remembered in this connection that there have been put in operation 5,395 miles of new line.

### Railway Equipment.

The additions to equipment in 1914 were:—Locomotives, 328; passenger cars, 306; freight cars, 21,969. During the past three years 77,032 of the latter have been put into the service and complaints of car shortage are reported to have ceased.

Following is a comparison between 1907 and 1914 of the number of locomotives and cars per 1,000 miles of track:

| | 1907. | 1914. |
|---|---|---|
| Locomotives | 156 | 176 |
| Freight cars | 4,783 | 6,636 |
| Passenger cars | 162 | 195 |

### Railway Employees.

On 30th June last there were 159,142 employees in the service of Canadian railways, and the aggregate of salaries and wages paid was $111,762,972. Salaries and wages were equal to 62.43 per cent. of the total operating expenses. The average rates of remuneration, which have been steadily ascending for a considerable number of years, made further slight advances.

### Accidents.

Railway operations for the year ended June 30, 1914, resulted in death to 600 persons and injury to 4,037. Of the deaths, 565 were caused by the movement of trains. The classes of persons affected were as follows:

| | Killed. | Injured. |
|---|---|---|
| Passengers | 27 | 415 |
| Employees | 224 | 3,161 |
| Trespassers | 289 | 279 |
| Non-trespassers | 48 | 114 |
| Postal clerks, etc. | 12 | 70 |

One passenger in every 1,868,091 was killed, and one in every 116,175 injured. Eighty-one persons were killed and 122 injured at highway crossings. Of the killed, 44 were trespassers at the time, presumably at protected crossings in cities and towns.

### Operating Mileage.

The operating mileage was increased in 1914 by 1,491, bringing the total up

to 30,795 miles. Here is how the railway mileage has grown since 1864.

| | |
|---|---|
| 1864 | 2,189 |
| 1874 | 4,331 |
| 1884 | 10,372 |
| 1894 | 15,627 |
| 1904 | 19,431 |
| 1914 | 30,795 |

**Capitalization.**

The capital liability of operative railways stood at $1,808,820,761 on 30th June, 1914, showing an increment of $276,990,069 for the year. This capitalization was divided as follows:—Stocks, $853,110,653; debenture stock, (C.P.R.), $173,307,470; funded debt, $782,402,636.

Stocks increased by $107,844,383 during the year, and bonds by $169,145,686.

The Canadian railways last year carried 46,702,280 passengers and 101,393,989 tons of freight. As compared with 1913 there was an increase of 471,515 in the number of passengers carried and a decrease of 5,598,721 in the number of tons of freight hauled. The tonnage grew from 48,097,519 in 1904, to 101,393,789 in 1914. The average receipts per mile per passenger was 2.007 cents, while the average of ticket sales per passenger was $1.328. There was an average of 59 passengers per train as against 62 in 1913. The average journey was 66 miles, the average number of passenger cars per train was 4.2, and the average number of passengers per car 14.

## FIRST CONTINGENT TRANSPORT PAYMENTS.

A statement of payments to steamship companies for the transport of the first contingent to England was given in the House of Commons on Feb. 23. The ships were refitted as transports at the expense of the Government, the cost of victualling being also borne by the Government. The payments were:—

Allan Line—Corinthian , $17,841.20; Grampian, $36,635; Scandinavian, $29,440; Scotian, $25,116; Sicilian, $17,831; Tunisian, $25,734.

Atlantic Transport—Manhattan, $34,142; P. V. G. Mitchell-Manitou, $30,461; Lapland, $39,056.

Red Star—Zeeland, $28,964.

White Star—Megantic, $36,198.

Dominion Line — Canada, $45,819; Laurentic, $72,464.

Canadian Northern—Royal George, $54,243.

Canadian Pacific—Ruthenia, $17,992; Tyrolea, $18,335; Montezuma, $20,342; Montreal, $21,033; Monmouth, $9,915; Virginian, $26,175.

Canada Steamship Lines—Bermudian, $20,184.

Cunard—Alauma, $65,237.

Robert Reford Company—Andania, $48,928; Franconia, $66,578; Invernia, $69,486; Saxonia, $69,578; Cassandia, $38,590; Lakonia, $22,805.

Donaldson Line—Athenia, $42,184.

Royal Mail Steam Packet Company—Arcadian, $21,751; Caribbean, $14,171.

Canadian Northern—Royal Edward, $45,080.

Thompson Line—Devonia, cancelled, $1,938. The cost of fitting and victualling approximated that of the hire of the ships.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

## CANADIAN TRADE COMMISSIONERS.

**Argentine Republic.**

H. R. Poussette, 278 Balcarce, Buenos Aires. Cable Address, Canadian.

**Australasia.**

D. H. Ross, Stock Exchange Building, Melbourne, Cable address, Cancoma.

**British West Indies.**

E. H. S. Flood, Bridgetown, Barbadoes, agent also for the Bermudas and British Guiana. Cable address, Canadian.

**China.**

J. W. Ross, 6 Kiuklang Road, Shanghai. Cable Address Cancoma.

**Cuba.**

Acting Trade Commissioner, Lonja del Comercio, Apartado 1290, Havana. Cable address, Cantracom.

**France.**

Phillipe Roy, Commissioner General 17 and 19 Boulevard des Capucines, Paris. Cable address, Stadacona.

**Japan.**

G. B. Johnson, P.O. Box 109, Yokohama. Cable Address, Canadian.

**Holland.**

J. T. Lithgow, Zuidblaak, 26, Rotterdam. Cable address, Watermill.

**Newfoundland.**

W. B. Nicholson, Bank of Montreal Building, Water Street, St. John's. Cable address, Canadian.

**New Zealand.**

W. A. Beddoe, Union Buildings, Customs Street, Auckland. Cable address, Canadian.

**South Africa.**

W. J. Egan, Norwich Union Buildings, Cape Town. Cable address, Cantracom.

**United Kingdom.**

E. de B. Arnaud, Sun Building, Clare Street, Bristol. Cable address, Canadian.

J. E. Ray, Central House, Birmingham. Cable address, Canadian.

Acting Trade Commissioner, North British Building East Parade, Leeds. Cable address, Canadian.

F. A. C. Bickerdike, Canada Chambers, 36 Spring Gardens, Manchester. Cable address, Cantracom.

Fred. Dane, 87 Union Street, Glasgow, Scotland. Cable address, Canacom.

Harrison Watson, 72 Basinghall Street, London, E.C., England. Cable address, Sleighing, London.

## CANADIAN COMMERCIAL AGENTS.

**British West Indies.**

Edgar Tripp, Port of Spain, Trinidad, Cable address, Canadian.

R. H. Curry, Nassau, Bahamas.

**Colombia.**

A. E. Beckwith, c-o Tracey Hmos, Medellin, Colombia. Cables to Marmato, Colombia. Cable address, Canadian.

**Norway and Denmark.**

C. E. Sontum, Grubbeged No. 4, Christiana, Norway. Cable address, Sontums.

**South Africa.**

D. M. McKibbin, Parker, Wood & Co., Buildings, P.O. Box 559, Johannesburg.

E. J. Wilkinson, Durban, 41 St. Andrew's Buildings, Durban, Natal.

## CANADIAN HIGH COMMISSIONER'S OFFICE.

**United Kingdom.**

W. L. Griffith, Secretary, 17 Victoria Street, London, S.W., England.

# INDUSTRIAL AND CONSTRUCTION NEWS

**Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.**

## Trade Gossip

**Wallaceburg, Ont.**—The Wallaceburg Brass Co. have received an order for a large number of plugs and sockets for shrapnel shells.

**Renfrew, Ont.**—The Renfrew Machinery Co. has now completed its building for the manufacture of shrapnel shells for the British War Office. The machinery has been installed, and work will be commenced this week.

**Geo. B. Jackson** of Guelph, Ont., has established a factory for making railway signal torpedoes. At a later date machinery will be required for making lead tubes and railway signal fusees. For making the latter, mixing machines will be required, also paper tube rolling and filling machines.

**Errata.**—In the article dealing with the Armstrong-Whitworth Co. new plant at Longueuil, Que., in Jan. 28 issue of Canadian Machinery, reference was made to motor generators supplied by Bruce Peebles & Co., Ltd., Edinburgh, Scotland. This should have been motor converters and not motor generators as stated.

**The Terry Steam Turbine Co.**, of Hartford, Conn., announce that their Chicago office will be located in the Peoples' Gas Building with A. W. de Revere in charge. The company has also opened an office in the Michigan Trust Building, Grand Rapids, Mich., in charge of A. L. Searles, to cover the southern peninsula of Michigan.

**Dominion Steel Corporation Activity.**—Operations in all departments of the Dominion Steel Corporation, with the exception of the rail mill, are reported by the president, J. H. Plummer, to be proceeding at 60 per cent. of the company's total capacity, and the prospects are bright for a continuance to that extent.

**Munitions of War Production.**—Speaking recently of the compensation to be made to persons whose factories the Government might commandeer under the Amendment to the Defence of the Realm Act, introduced in the House of Commons by Chancellor of the Exchequer Lloyd George, the latter promised that everything possible would be done to reduce inconvenience and loss. Continuing, he said: "It is, however, a matter of life and death with this Empire that we increase enormously our supplies of munitions of war, in spite of the possible loss to individuals. The national needs are so overwhelming that I hope those who are inconvenienced in the matter of contracts will put up with it."

**Wagon Cover Order.**—Having almost completed an order from the Government for some six thousand kit bags for the Canadian troops, the Western Tent & Mattress Co., of Calgary, is now about to start on another order of four hundred transport wagon covers. The kit bags mean about $4,000 to the firm, while the wagon covers mean another $9,000.

**Bullet Lead.**—Six thousand tons of pig lead, sufficient to make six hundred million rifle bullets of standard weight, was shipped on March 18 from the Omaha, Nebraska, branch of the American Smelting and Refining Co., direct to London, where it will be used by the allies in manufacturing bullets. When loaded, the shipment filled ten trains of twenty cars each, and in each car were thirty tons.

**Moral Conduct Appeal.**—The Carnegie Steel Co. of Pittsburg has issued an appeal to its thousands of employees to lead a moral life as a means of increasing their own safety while at work and of improving their chances for promotion. If to be good is to be successful, it will not be the company's fault if its workers who accept the advice do not develop into benevolent and rich old gentlemen like its founder.

**Demand for Powder.**—President Pierre S. Dupont, of the E. I. Dupont de Nemours Powder Co., announces that sufficient orders have been received from the belligerent powers to warrant the company in making large extensions to its plants. "Our expenditure in construction may reach $5,000,000 or more," he said. Land has already been purchased on the James River, in Virginia, for a new factory for the manufacture of dynamite and gunpowder.

**Canadian National Exhibition.**—It is announced that two firms have made application to instal a plant at the Toronto Exhibition this year to demonstrate their shell-making abilities. There are also applications in from a couple of rubber firms asking for space in order that the manufacture of rubber goods be shown. The Exhibition authorities are elated by the large number of firms who have applied for space to show goods in the process of manufacture.

**Shell Orders From Russia.**—The largest single order for war materials yet recorded among the many already placed in the Dominion has just been let by the Russian Government to the Canadian Car & Foundry Co., Montreal and Amherst, N.S. The order is for shrapnel shells of various calibre, and the amount of the order, it is stated, is practically limited only to the capacity of the company and of such sub-contractors in Canada and the United States among whom it may be divided.

**Edison and Toluol Production.**—According to the New York Herald, Thos. A. Edison, the inventor, may have a considerable interest in the Dominion Steel Corporation new toluol plant at Sydney. Mr. Edison is building a plant at Johnstown and another may be built at a place not yet decided upon. The construction of the plants is referred to as a gamble on the duration of the war. "As soon as the war is over, Germany will make carbolic acid much cheaper than I am making it," he said. Ultimate victory, however long delayed, must, he thinks, rest with the allies. The toluol product used in the manufacture of high explosives, which promises to be a profitable adjunct to Dominion Steel's business, has risen enormously in value since the war started.

**Machine Tool Contracts Placed.**—The following contracts have been placed for machine tools for the new Technical School, Toronto:

Fourteen 14-in. engine lathes and two 14-in. tool room lathes built by the Canada Machinery Corporation, Galt, awarded to the A. R. Williams Machinery Co., Ltd., Toronto.

One precision lathe, Rivett make, awarded to the Canadian Fairbanks-Morse Co., Toronto.

Twenty-three 14-in. woodworking lathes, to the Preston Woodworking Machinery Co., Preston, Ont.

One 20-in. swing, patternmakers lathe, to Wm. Garlock, Toronto, representing the American Woodworking Machinery Co.

Small metal working tools to the Aikenhead Hardware Co., Toronto.

Small woodworking tools to the British-American Hardware Mfg. Co., Toronto.

Work benches to the Robt Simpson Co., Toronto.

**Hamilton, Ont.**—The Dominion Sheet Metal Co., capitalized at $300,000, has decided to build a factory here for making galvanized sheets. A. T. Enlow of Oshawa will be manager.

**Algoma Steel Corporation.**—A contract for 35,000 tons of 90-pound rails has been placed by the Illinois Central Railway with the Algoma Steel Company. Under the terms of the contract the delivery of the rails will be subject to what is known as the "nick-and break test," which is regarded by steel experts as the most severe form of testing rails. The contract, which will total almost $1,000,000, was accepted by the Canadian company upon the basis of $27 a ton, which was $5 a ton less than the next nearest American competitor.

## Electrical

**Tara, Ont.**—The council are contemplating installing a hydro-electric lighting system.

**Newmarket, Ont**—The Toronto & York Radial Railway Co. will commence work on the electric lighting system this week.

**Orillia, Ont.**—The Orillia Water, Light and Power Commission has made a reduction of 10 per cent. on all existing light and power rates.

**Toronto, Ont.**—Tenders closed on March 25 for a brick transformer house on Sterling road for the Toronto Electric Commission. Particulars obtainable at the Duncan street station.

**Toronto, Ont.**—The New Toronto Power, Light and Water Commission, in agreement with the Etobicoke Township Council, have decided to take over the entire operation of the extension in the township.

**Kincardine, Ont.**—The electric light and water commission has under consideration a plan for the improvement of the street ilghting system. A committee composed of W. J. Henry, J. B. Watson and Superintendent Ingram has been selected to look into the matter.

## General Industrial

**Oil Springs, Ont.**—A company is being formed to manufacture cement tiles. The Board of Trade has the matter in hand.

**Greenfield, Ont.**—The municipal council are receiving tenders up to April 10 for about 20,450 lb. of twisted steel reinforcing bars. J. D. Cameron, clerk of Kenyon Township.

**Thorold, Ont.**—Pilkington Bros., Ltd., will build an addition to their plant. Austin Bros., Cleveland, Ohio, are the contractors.

**Leamington, Ont.**—The Heinz Company here are duplicating their vinegar factory, making thereby a very important extension to their establishment.

**Toronto, Ont.**—Fire destroyed the mattress factory of the Whitworth & Restalls Co. on March 17. The damage is estimated at $20,000, part of which is covered by insurance.

**Renfrew, Ont.**—Allan Francis and A. A. Wright were in Peterboro and Toronto recently investigating machinery for the manufacture of ice cream with the view to installing a plant in the Renfrew Creamery.

**ALLIES PURCHASING AGENTS.**

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**British—Col. A. G. Barton and A. C. Billing, Ritz Carlton Hotel, Montreal.**

**French—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.**

**Russian — Messrs. S. Ruperti and Aiekieff, care Military Attache, Russian Embassy, Washington, D.C.**

**Welland, Ont.**—E. R. C. Clarkson & Son, liquidators of the Canadian Automatic Transportation Co. of this town, announce that they have sold the plant to W. C. Carr, who was largely interested. It is the latter's intention to carry on the manufacture of the same electrical devices as were made by the old company.

**Hamilton, Ont.** — The Procter & Gamble Co., who are erecting a million and a half dollar plant in the east end, have decided to erect another large building, approximately 500 by 175 feet, in addition to the five large buildings now under construction. All the buildings in this new plant are of steel construction and built in with white pressed brick.

**Saskatoon, Sask.**—Directors of the Northern Flax and Fibre Co., a large American corporation, with headquarters at Great Falls, Montana, will make a visit to Saskatoon in the near future, to arrange for the immediate installation of a flax mill here. This news has been received at the Board of Trade offices after lengthy negotiations for the location of a mill here.

**Toronto, Ont.**—The modern two-storey fertilizer plant of Gunn's, Limited, St. Clair Avenue, West Toronto, was totally destroyed by fire early Saturday morning. The loss is estimated at $40,000, which is covered by insurance. The building contained several tons of potash. A large quantity of expensive machinery was also totally destroyed. It is the intention of the company to rebuild immediately.

**Preston, Ont.**—At a special meeting of the Board of Trade it was decided that the ratepayers purchase the property given by the town to the Anchor Bedding Co. of Toronto and turn it over to a company which proposes to manufacture wooden handles. The bedding company failed after the ratepayers agreed to loan them $25,000 and provide a free building site, and the buildings are now valued at $24,580.

## Municipal

**Markham, Ont.**—It is proposed to install a waterworks system. James Loudon & Hertzberg, of Toronto, are the engineers.

**London, Ont.**—The Dominion Government will make a grant of $5,000 for each of three subways that it is proposed to construct. The total cost for each subway is estimated at $50,000.

**Newmarket, Ont.**—At the regular meeting of the town council held last Monday it was decided to install a new reservoir at the waterworks. The reservoir, which will cost $2,500, will be made of reinforced concrete.

**Bracebridge, Ont.**—By-laws will be voted on by the ratepayers on April 12 to authorize raising $4,000 for new pumps; $2,700 for main extensions; $5,300 for other improvements in connection with the waterworks system.

**Ottawa, Ont.**—At a recent meeting of the city council, the motion of Controller Ellis to ask the Legislature to approve of raising $400,000 to provide for the building of the Lemieux Island overland pipe was carried without dissension.

**Brockville, Ont.**—The special committee of the Water and Light Departments and the Board of Health have recommended the construction of a rapid sand filter plant of the gravity type, at a cost of $85,000, and that a new 24-in. intake

pipe to run 500 feet into the river be purchased, the intake estimate being $7,000.

**Owen Sound, Ont.**—Two Toronto men have been here looking over the site for the proposed municipal elevator. They met members of the Board of Trade, and will submit estimates on the cost of a half-million-bushel concrete elevator, to be owned and operated by the town. The cost will be about $200,000, according to preliminary figures.

**Lindsay, Ont.**—The Canadian Boving Co. industrial by-law will be re-submitted to the property owners of Lindsay at the earliest possible date, providing the report of the auditors at present working on the company's books proves satisfactory. The original by-law was to authorize a bond guarantee of $30,000, but it was turned down.

# Tenders

**Victoria, B. C.**—Tenders will be received up to Monday, April 5, 1915, for the following water meters: 25 1-inch, 10 1½-inch, 12 2-inch, 3 3-inch, 1 4-inch. Specifications may be seen at the office of W. Galt, the city purchasing agent.

**Toronto, Ont.**—Tenders will be received up to March 30, 1915, for the complete supply and installation of extension to electric lighting system and fixtures at the premises of Toronto Jail, Gerrard street east. Copy of specification may be seen and tender form obtained at the offices of the Property Department, City Hall, Toronto.

**Adamsville, Que.**—Tenders will be received up to March 31 by the undersigned for the building of the iron work only of an iron bridge, 130 feet long. Plans and specifications can be seen at the secretary's office at any time. Municipality of the East Part of the Township of Farnham. O. Landry, Sec.-Treas., Adamsville, Que.

**Toronto, Ont.**—Tenders will be received up to April 10, 1915, for the construction of four concrete piers and two concrete abutments at Bridge 107.2, Muskoka Subdivision, over Shaw's Creek, about 7½ miles south of Bala. Forms of tender may be obtined and plans and specifications seen at the office of the resident engineer, room 510, Union Station.

**Montreal, Que.**—Tenders for the supply and installation of underground cables; lamps and lamp-standards, and concrete foundations for same; for underground street lighting distribution on St. Catherine and Bleury streets, will be received by the Board of Commissioners until Tuesday, April 6, 1915. Specifications, forms of tender, and all required information, may be obtained at the office of the Superintendent of Purchases and Sales, City Hall.

**Fredericton, N.B.**—Tenders will be received at the Department of Public Works, Fredericton, until March 31, 1915, for constructing the steel superstructure of a new bridge, to take the place of the present wooden highway bridge at Moncton over the Petitcodiac River; one through fixed riveted steel truss span of 355 feet from centre to centre of end bearings; four through fixed riveted steel truss spans of 261 ft., 6 in. from centre to centre of end bearings, according to plans and specifications to be seen at the Public Works Department, Fredericton, N.B. John Morrissy, Minister of Public Works.

**Vancouver, B.C.**—Tenders will be received up to March 31, for the supply of the following articles for the use of the B.C. dredging fleet at Vancouver, B. C., for 12 months ending March 31, 1916: Hardware; packings; Manila rope; wire rope; chain; steam pipe; valves and fittings; oils and greases; paint, paint oils, etc.; hose; brooms and brushes; steel castings. Forms of tender may be obtained at the office of G. B. Hughes, district engineer, Victoria, B.C.; at the office of C. C. Worsfold, district engineer, New Westminster, B. C.; and at the office of J. L. Nelson, supt. of dredges, 614-18 Birks Building, Vancouver, B.C.

**Toronto, Ont.**—Tenders will be received by the Chairman of the Board of Control, City Hall, up to Tuesday, March 30, 1915, for the supply of: Sweeper body and equipment for Toronto civic railway, St. Clair Avenue division. Equipment for machine shop for Toronto civic railway, Danforth Avenue car barn. Mechanical and electrical equipment for car bodies for Toronto civic railway, Lansdowne Avenue extension. Four car bodies for Toronto civic railway, Lansdowne Avenue extension. Coal for water supply section. Specifications and tender form for the foregoing may be obtained upon application at Room 12, Purchasing and Accounting Section of the Department of Works, City Hall, Toronto.

**Ottawa, Ont.**—Tenders will be received at this office until Wednesday, April 7, 1915, for the construction of one new chain of buckets, tumblers, together with spare parts, for dredge "Mastodon." Plans, specification and form of contract can be seen and forms of tender obtained at the Department of Public Works, Ottawa, and at the offices of A. Kastella, Esq., mechanical superintendent, Birks Building, Ottawa, Ont.; J. L. Nelson, Esq., supt. of dredges, Vancouver, B.C.; G. B. Hughes, Esq., district engineer, Victoria, B.C.; C. C. Worsfold, Esq., district engineer, New Westminster, B.C.; F. Y. Harcourt, Esq., district engineer, Port Arthur, Ont.; J. M. Wilson, Esq., acting district engineer, Toronto, Ont., and A. E. Dubuc, Esq., district engineer, Montreal, Que.

# Contracts Awarded

**John T. Hepburn, Ltd.**, Toronto, received the contract from that city for the annual supply of cast-iron special castings, at $1.82½ per 100 pounds.

**Ottawa, Ont.**—A contract has been awarded by the city council to T. Lawson & Sons of this city, for supply of iron castings, service posts, etc., at $2.40 per 100 lb.

**Winnipeg, Man.**—The Dominion Bridge Co. has been awarded the contract for the construction of the Lee river bridge on the way to the Point du Bois power plant at $19,383.37.

**Welland, Ont.**—The General contract for the construction of an addition to the plant of the Canada Forge Co. has been awarded to the Standard Steel Construction Co., the estimated cost being $12,000.

**Toronto, Ont.**—Contracts for large special castings for waterworks requirements in North Toronto have been awarded to Canadian Allis-Chalmers, Ltd., Reid & Brown Structural Steel and Iron Works, Ltd., and the John Inglis Co.

# Railways-Bridges

**Kenora, Ont.**—James Fraser, Government road and bridge inspector, sent out this week a number of men with pile driver supplies, etc., to build a new bridge over Rice creek in the northern portion of Melick township. The new bridge will cost about $900.

**Penticton, B.C.**—At a meeting of the Board of Trade it was informally announced that the Great Northern Railway will go ahead with its proposed line up the Okanagan from Oroville to Penticton. This line will give Penticton connection with Vancouver.

**Ottawa, Ont.**—The Commons Railway Committee on March 11 passed the bill allowing the amalgamation of the Toronto, Hamilton & Buffalo Railway and the Erie & Ontario Railway. The T. H. & B. now extends from Brantford to Buffalo, and is operated by the C. P. R. The Erie & Ontario is partly built, and is to extend from a port on Lake Erie

north through Brantford to join the C. P. R. main line.

**Toronto, Ont.**—It is reported that the Toronto-to-Guelph Electric Railway is to be finished and in operation by the end of July or by August this year. The steel is laid; the ballasting of the road is to be rushed to completion. The electrification of the road has also commenced. The railway is 46 miles long, stretching from Toronto to Lambton, Cooksville, Meadowvale, Huttonville, Norval, Georgetown, Limehouse, Acton, Eden Mills, to Guelph. The completion of the road represents an investment of approximately $3,000,000. Three transformers are to be built, one at Guelph, the plans of which are under way, one at Georgetown, and one near Toronto, probably on the Dundas road.

**Canada Watches Lakes.**—That Dominion authorities fear the laying of mines in various Canadian harbors was expressed in a communication received by Roscoe House, lighthouse inspector of the Buffalo district. The notice advised that it was probable that the ports of Quebec, Halifax, N.S., and Esquimalt, B.C., would be closed at various times to allow government vessels to sweep the harbors, to assure all merchant marines safety in arrival or clearance. To warn vessels that entrance is prohibited to these harbors, three red lights will be shown by night and three red balls by day. Shipmasters sighting these must keep to sea or anchor at points charted as "examination anchorages." Examining vessels, so designated by lights or flags, will meet incoming boats there. When these ports are open for navigation, three white vertical lights by night or corresponding signals by day will be shown.

## New Incorporations

**The James Frid Co.** has been incorporated at Ottawa, Ont., with a capital of $100,000 to carry on the business of general contractors at Toronto, Ont. Incorporators: J. W. Frid, A. Frid and M. Boag, all of Winnipeg, Man.

## Marine

**Sarnia, Ont.**—It is probable that harbor improvements, to cost $50,000, will be proceeded with this season.

**Ferry Ready for Launching.**—The steel car ferry Ontario No. 2 will be launched on Saturday, April 3, at 2.30 p.m., from the Polson Ironworks, Toronto.

**Victoria, B. C.**—The steamer Bessie Dollar will clear from this port about the beginning of April with four million feet of lumber, part of an order of twenty-five million feet destined for the harbor improvements in Toronto. She will steam via the Panama Canal.

**Ship Masters Organize.**—A local branch of the Ship Masters' Association of the Great Lakes was recently organized in Toronto, at a meeting in the Iroquois Hotel, at which the following officers were elected: President, Captain J. Mann; first vice-president, O. Patterson; second vice-president, N. McGlennon; secretary-treasurer, A. E. Stinson; chaplain, Captain E. Smith; marshall, Captain Jefferies; warden, H. Patterson; sentinel, — Sexsmith.

**Northern Navigation Co.**—The Northern Navigation Co. has issued the following list of appointments of captains and chief engineers of the steamers of its fleet: Noronic, R. D. Foote, Samuel Brisbin; Hamonic, A. L. Campbell, John Smith; Huronic, A. M. Wright, John Dow; Majestic, J. D. Montgomery, engineer not yet appointed; Germanic, F. G. Moles, S. Burgess; City of Midland, F. A. Garret, J. Osburn; Waubic, G. W. Kinnee, S. Beatty; Ionic, O. Wing, Engineer not yet appointed.

## Building Notes

**Weston, Ont.**—A Masonic Temple is to be erected this spring on Main street by Humber Lodge A. F. and A. M. The estimated cost of the building is $10,000.

**Sarnia, Ont.**—The council will probably award the following contracts in connection with the rebuilding of the city hall: Mackness & Struthers, heating and plumbing; J. Filsinger, electric wiring and galvanized iron work; A. Lawson, metallic ceilings.

**Montreal, Que.**—Something between $800,000 and $1,000,000 may be invested in two large blocks of buildings this summer, according to plans which are

being considered now by English and Belgian capitalists. One block is for business purposes; the other will be residential. The plans for the building will be had in the office of Clarence I. De Sola, Coristine Building.

## Contracts Awarded

**Toronto, Ont.**—The Toronto Hydro-Electric Commission at its meeting on March 18, awarded a contract worth $40,000 to the Canadian General Electric Co., for transformers to be used throughout the system. The commission has also awarded contracts for about 7,000 meters for a year's needs on the system. Chamberlain & Hookham, of Birmingham, Eng., get a share of the contract; Packards, the Northern Electric Co., and other share in the contract, which is worth about $35,000

## Wood-Working

**Drayton, Ont.**—Buckman Bros. may extend their box factory. An expenditure of $8000 is contemplated.

**Sarnia, Ont.**—Word has been received that the mills of the Spanish River Lumber Co. at Cutler, Ont., on the north shore of Lake Huron, were destroyed by fire. No particulars were given.

**Fort Frances, Ont.**—It is understood that a deal has just been closed whereby the saw mills of the Northern Construction Co., together with all their timber limits, have been acquired by P. J. Noel, the superintendent, and D. D. McKay, a Minneapolis manufacturer and capitalist.

**Hanover, Ont.**—The Glaesar & Leinberger factory will again be in operation in a few days. A joint stock company, to be known as "Meades Upholstering Co., Limited," is bein gorganized and is applying for a charter. The provisional directors are: W. Meades, Dh. Taylor, R. Brunt, G. A. Bozel, and J. Jagelewski. It will be capitalized at $50,000.

Contracts Awarded— £ et

## Refrigeration

**Toronto, Ont.**—Gunns, Limited , have taken out a permit for the erection of a cold-storage warehouse at 80 Front street. The building will cost $6,000.

**Hamilton, Ont.**—The property committee has under consideration a proposal to instal a cooling plant in Central market hall for the benefit of the butchers.

# Book Reviews

**Electric Elevators,** by Elmer G. Henderson; 90 pages, 7½ in. x 5 in. Published by the Joseph G. Branch Publishing Co., Chicago, Ill. Price, $1 post-paid. This book deals with the construction and operation of electric elevators in a practical way, all technical matter having been avoided where possible. The author is a practical elevator constructor, and is thus able to treat the subject in a manner which should be readily understood by those engaged in the construction and operation of elevators. It will, therefore, be inferred that the book was written for this class of reader. The book contains twelve chapters. The first three deal with elevators of various types, including the different arrangements of the mechanical and electrical equipment and the counter-balancing of elevator motors. The following two chapters deal with the construction of D.C. and A.C. motors. In chapters 6, 7 and 8 the construction of various types of controller are described and their relation to the operation of the elevator dealt with fully. Governor and push-button devices are described in chapters 9 and 10, while chapter 11 contains an extract from the Chicago building ordinances. The concluding chapter contains a number of useful electrical tables. The book contains 41 illustrations carefully indexed, while in addition there is the usual table of contents. The book is practical, covers the subject thoroughly and contains much useful information for those engaged upon electric elevator construction.

# Catalogues

**The Hydraulic Press Mfg. Co.,** Mount Gilead, Ohio, has published bulletin No. 5001, describing a new 30-ton hydraulic pipe-bending press. A brief specification is also included, accompanied by an illustration.

**The Buffalo Forge Co.,** Buffalo, N.Y., has recently published a series of bulletins and catalogues which contain much useful data on fans and blowers. Catalogue No. 200 describes the Buffalo planoidal fans, a modification and improvement on the older type of steel plate heating and ventilating fans with a comparatively small number of radial blades. Catalogue 201 deals with Niagara conoidal fans, and catalogue 182-E is a collection, for convenient reference, of the various types of blowers and exhaust fans, which are regularly built for direct connection to motors. This includes everything from large ventilating and drying fans down to the little "Baby" conoidals for ventilation of moving picture booths and drying cabinets, also electric blowers for single forge fires, which take less than half the horsepower of an ordinary electric lamp.

# "B & C" Combination Wrench

**General Utility and All-round Convenience that Has No Equal**

DOES THE WORK OF A NUT WRENCH AND PIPE WRENCH, IS EQUALLY HANDY AND EFFICIENT IN EITHER CAPACITY, AND COSTS BUT LITTLE MORE THAN AN ORDINARY WRENCH.

Head, Bar and Shank one-piece steel forging. Made from the best of materials. Thoroughly case-hardened. All parts interchangeable.

**Write for complete catalog on wrenches.**

TRADE B&C MARK

## Bemis & Call Hardware and Tool Co.

**Springfield, Mass., U.S.A.**

# Winning the Buyer's Favor

The best possible buyer is not made an actual buyer at a single step.

It is one thing to win the buyer's favor for an article and another to make adjustments incident to closing the sale. Winning the buyer's favor is the work of trade paper advertising.

Under ordinary conditions it should not be expected to do more.

**Drift Bolt Cutters.**

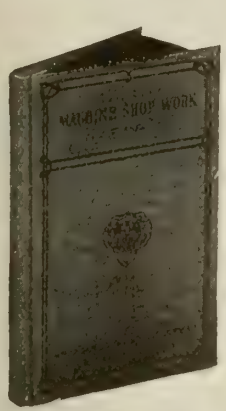
# Mechanical Engineering Books

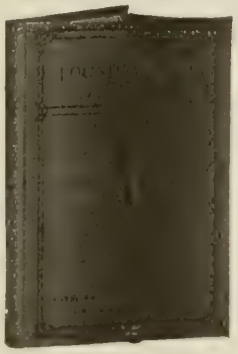
If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.

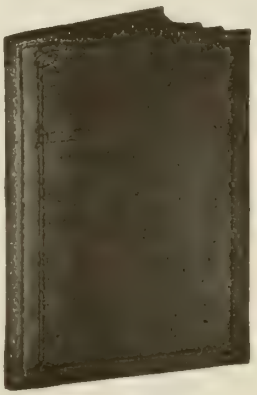


**MACHINE-SHOP WORK.** By Frederick W. Turner, Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price ...$1.50

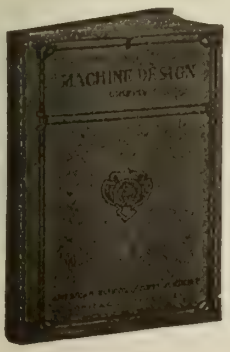
**MECHANICAL DRAWING.** By Ervin Kenison, S.B., Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price ..... $1.00

**FOUNDRY WORK.** By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 142 illus. Cloth binding. A practical guide to modern methods of moulding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price .....$1.00





**PATTERN MAKING.** By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price .....$1.00



**MACHINE DESIGN.** By Charles L. Griffin, S.B., Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price .....$1.50

**FORGING.** By John Lord Bacon, Eng. and Supt of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price .....$1.00

**TOOL MAKING.** By Edward R. Markham, Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers, Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels—annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, bobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price ..... $1.50

Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

## Technical Book Department

**MacLean Publishing Co.** **143 University Ave., Toronto**

**Gears, Cut, Mortise, Angle Worm**
Earle Gear & Machine Co., Philadelphia, Pa.
Gardner, Robt., & Son, Montreal.
Hamilton Gear & Machine Co., Toronto.
Jones & Glassco, Montreal, P.Q.
Smart-Turner Machine Co., Hamilton, Ont.
Wm. Tod Company, Youngstown, O.

**Gears, Rawhide.**
Gardner, Robt., & Son, Montreal.
Hamilton Gear & Machine Co., Toronto.
Jones & Glassco, Montreal, P.Q.
Smart-Turner Machine Co., Hamilton, Ont.

**Generators, Electric.**
A. R. Williams Machy. Co., Toronto.
Can. Fairbanks-Morse Co., Montreal.
Canadian Westinghouse Co., Hamilton.
Lancashire Dynamo and Motor Co. Ltd., Toronto.
Toronto & Hamilton Electric Co. Hamilton.

**Grain for Polishing.**
Norton Co., Worcester, Mass.

**Grates, Shaking and Dumping.**
Erie Foundry Co., Erie, Pa.

**Graphite.**
Can. H. W. Johns-Manville Co., Ltd. Toronto.
Jos. Dixon Crucible Co., Jersey City.
Stevens, F. B., Detroit, Mich.

**Gravity Lowering Blocks.**
Herbert Morris Crane & Hoist Co., Ltd., Toronto.

**Grinders, Automatic Knife.**
W. H. Banfield & Son, Toronto.

**Grinders, Centre, Pedestal and Bench.**
Cleveland Pneumatic Tool Co. of Canada, Toronto.
Ford-Smith Machine Co., Hamilton.
Niles-Bement-Pond Co., New York.
Morse Twist Drill and Machine Co. New Bedford.
Stow Mfg. Co., Binghamton, N.Y.
United States Electrical Tool Co., Cincinnati, O.

**Grinders, Cutter.**
Pratt & Whitney Co., Dundas, Ont.

**Grinders, Die Chaser.**
Bignall & Keeler Mfg. Co., Edwardsville, Ill.
Landis Machine Co., Waynesboro, Pa.
Modern Tool Co., Erie, Pa.

**Grinders, Disk.**
Armstrong Bros. Tool Co., Chicago, Ill.
Gardner Machine Co., Beloit, Wis.

**Grinders, Drill.**
Garvin Machine Co., New York.

**Grinders, Cylinder, Internal.**
Bath Grinder Co., Fitchburg, Mass.
Fitchburg Grinder Co., Fitchburg, Mass.
Hill, Clarke & Co. of Chicago, Chicago, Ill.
Landis Tool Co., Waynesboro, Pa.
Modern Tool Co., Erie, Pa.
Motch & Merryweather Machy. Co., Cleveland, O.
Rivett Lathe & Grinder Co., Boston, Mass.

**Grinders, Pneumatic.**
Cleveland Pneumatic Tool Co. of Canada, Toronto.
Independent Pneumatic Tool Co., Chicago, Ill.

**Grinders, Portable, Electric Hand, Tool, Post, Floor and Bench.**
Baird Machine Co., Bridgeport, Conn.
Bath Grinder Co., Fitchburg, Mass.
Fitchburg Grinder Co., Fitchburg, Mass.
Hill, Clarke & Co., of Chicago, Chicago, Ill.
A. R. Williams Machy. Co., Toronto.
Motch & Merryweather Machy. Co., Cleveland, O.
Norton Co., Worcester, Mass.
United States Electrical Tool Co. Cincinnati.

**Grinders, Swing, Portable, Electric.**
United States Electrical Tool Co. Cincinnati

**Grinders, Tool and Holders.**
Armstrong Bros. Tool Co., Chicago.
W. F. & John Barnes Co., Rockford, Ill.
Bath Grinder Co., Fitchburg, Mass.
Blount, J. G. & Co., Everett, Mass.
Fitchburg Grinder Co., Fitchburg, Mass.
Hill, Clarke & Co. of Chicago, Chicago, Ill.
Motch & Merryweather Machy. Co., Cleveland, O.
Rivett, Lathe & Grinder Co., Boston, Mass.
Tabor Mfg. Co., Philadelphia, Pa.

**Grinders, Universal, Plain.**
Landis Tool Co., Waynesboro, Pa.
Modern Tool Co., Erie, Pa.

**Grinders, Vertical Surface.**
Can. Fairbanks-Morse Co., Montreal.
Pratt & Whitney Co., Dundas, Ont.

**Grinding and Polishing Machines, Portable, Pneumatic and Spring Frame.**
Bath Grinder Co., Fitchburg, Mass.
Can. Fairbanks-Morse Co., Montreal.
Fitchburg Grinder Co., Fitchburg, Mass.
Gardner, Robt. & Son, Montreal.
Garvin Machine Co., New York.
Hall & Sons, John H., Brantford.
Hill, Clarke & Co., of Chicago, Chicago, Ill.
Independent Pneumatic Tool Co., Chicago, Ill.
Motch & Merryweather Machy. Co., Cleveland, O.
Niles-Bement-Pond Co., New York.
Stow Mfg. Co., Binghampton, N.Y.

**Grinding Wheels.**
Can. Fairbanks-Morse Co., Montreal
Carborundum Co., Niagara Falls.
Ford-Smith Machine Co., Hamilton.
Norton Co., Worcester, Mass.

**Guards, Window and Machine.**
Canada Wire & Iron Goods Co., Hamilton, Ont.
Dennis Wire & Iron Works Co., Ltd., London, Canada.

**Hack Saw Blades.**
Victor Saw Works, Ltd., Hamilton, Canada.
Diamond Saw & Stamping Works, Buffalo, N.Y.
L. S. Starrett Co., Athol, Mass.

**Hack Saw Frames.**
Ford Smith Machine Co., Hamilton, Canada.
Garvin Machine Co., New York City.
Mussens, Limited, Montreal.

**Hammers, Drop and Belt Driven.**
Bliss, E. W., Co., Brooklyn, N.Y.
Brown, Boggs Co., Ltd., Hamilton, Canada.
Canadian Billings & Spencer, Ltd., Welland.
Erie Foundry Co., Erie, Pa.
A. B. Jardine & Co., Hespeler, Ont.
National Machinery & Supply Co., Hamilton.
Niles-Bement-Pond Co., New York.
Plessisville Foundry, Plessisville, Que.
Toledo Machine & Tool Co., Toledo.

**Hammers, Helve Power.**
West Tire Setter Co., Rochester, N.Y.

**Hammers, Pneumatic.**
Independent Pneumatic Tool Co., Chicago.
Cleveland Pneumatic Tool Co., of Canada, Toronto.

**Hammers, Steam.**
John Bertram & Sons Co., Dundas.
Erie Foundry Co., Erie, Pa.
National Machine & Supply Co., Hamilton.
Niles-Bement-Pond Co., New York.

**Hand Hoists & Trolleys.**
Herbert Morris Crane & Hoist Co., Ltd., Toronto.
Whiting Foundry Equipment Co., Harvey, Ill.

**Hand Leathers or Pads.**
Graton & Knight Mfg. Co., Montreal.

**Hangers.**
Baird Machine Co., Bridgeport, Conn.
Gardner, Robt. & Son, Montreal.
The Smart-Turner Machine Co., Hamilton.
Standard Pressed Steel Co., Philadelphia, Pa.

**Heat Treating.**
Steel Improvement Co., Cleveland, O.

**Heating and Ventilating Engineers.**
Can. Buffalo Forge Co., Montreal.
Can. Sirocco Co., Ltd., Windsor, Ont.
Hooper-Falkenau Eng. Co., New York.
Sheldons, Ltd., Galt, Ont.

**Hinge Machinery.**
Baird Machine Co., Bridgeport, Conn.

**Hinges.**
London Bolt & Hinge Works, London, Ont.

**Hoists, Hydraulic.**
Watson-Stillman Co., Aldene, N.J.

**Hoists, Self Landing and Self Delivery.**
Herbert Morris Crane & Hoist Co., Ltd., Toronto.

**Hoisting and Conveying Machinery.**
Herbert Morris Crane & Hoist Co., Ltd., Toronto.
Northern Crane Works, Walkerville.
Owen Sound Iron Works Co., Owen Sound.
Whiting Foundry Equipment Co., Harvey, Ill.

**Hoists, Chain, Electric and Pneumatic.**
Marsh & Henthorn, Belleville, Ont.
Herbert Morris Crane & Hoist Co., Ltd., Toronto.
Northern Crane Works, Walkerville.
Whiting Foundry Equipment Co., Harvey, Ill.

**Hoists, Electric.**
Northern Crane Works, Walkerville.
Whiting Foundry & Equipment Co., Harvey, Ill.

**Hoists, Monorail Type, Electric Travelling.**
Manning, Maxwell & Moore, Inc., New York.
Shaw Electric Crane Co., New York.

**Hooks.**
Herbert Morris Crane & Hoist Co., Ltd., Toronto.

**Hose Clamp Tool.**
Cleveland Pneumatic Tool Co. of Canada, Toronto.

**Hose, Pneumatic.**
Canadian Westinghouse Co., Hamilton.
Cleveland Pneumatic Tool Co. of Canada, Toronto.
Independent Pneumatic Tool Co., Chicago.

**Hose, Steam, Suction and Water.**
Can. H. W. Johns-Manville Co., Limited, Toronto.

**Holders for Dies and Drills.**
Wells Brothers Company, Greenfield, Mass.
Wilt Twist Drill Co. of Canada, Ltd., Walkerville, Ont.

**Hydraulic Accumulators.**
Can. Fairbanks-Morse Co., Montreal.
Niles-Bement-Pond Co., New York.
The Smart-Turner Machine Co., Hamilton
Watson-Stillman Co., Aldene, N.J.

**Hydraulic Machinery.**
Niles-Bement-Pond Co., New York.
John Inglis Co., Toronto.
National Machinery & Supply Co., Hamilton.
Watson-Stillman Co., Aldene, N.J.

**Indicators, Speed.**
L. S. Starrett Co., Athol, Mass.

**Index Centres.**
Garvin Machine Co., New York.

**Industrial Engineers.**
Hooper-Falkenau Eng. Co., New York.

**Iron Filler.**
Can. H. W. Johns-Manville Co., Ltd., Toronto.

**Iron Ore.**
Hanna & Co., M. A., Cleveland, O.

**Jacks, Hydraulic.**
Watson-Stillman Co., Aldene, N.J.

**Jacks.**
Can. Fairbanks-Morse Co., Montreal.
Herbert Morris Crane & Hoist Co., Ltd., Toronto.
Northern Crane Works, Walkerville.
Norton, A. O., Coaticook, Que.
Plessisville Foundry, Plessisville, Que.

## SEND YOUR INVENTION DIRECT TO OTTAWA—

The Patent business of Canada naturally centers in Ottawa. Here are the records of the Patent Office, and here is its examining corps, before some one of whose members all Applications for Letters Patent must pass for review and criticism. That such application may be facilitated and **much time saved by the employment of competent attorneys on the ground** with ready access to the Patent Office for personal oral discussion of cases with the examiners and prompt filing of amendments and other documents, is obvious. This is admitted by all the large firms located in other cities, practically all of whom are represented in Ottawa, and that **inventors have come to see the great advantage of sending their cases direct to Ottawa**, avoiding the delays and occasional misunderstanding, incident to passing the case, and amendments through two or more Attorneys' offices, is abundantly shown by the large number of applications filed directly through Ottawa Patent Attorneys.

Being located only one door from the Patent Offices, we are in the best position to give you valuable assistance in securing your Canadian Patent. We assure you that in placing your Invention in our hands, it will receive prompt and competent attention. The policy of this firm is to give the best satisfaction possible to our clients.

### WE MAKE A FREE SEARCH OF PATENT OFFICE RECORDS—

If you have an invention, send us a sketch, photograph or model of it. We will give you a report as to its patentability absolutely free. **We have a number of mechanical engineers and skilled draftsmen who are at the service of our clients to assist them in perfecting their inventions with meritorious ideas, and who require expert advice to produce the invention in practical and commercial form, and the suggestions of our experts are of great aid to our clients.**

**PATENTS FOR SALE** We invite Manufacturers and Promoters to address our Sales Department regarding the purchase or leasing of a number of meritorious Patents secured by us.

**THE PATENT REVIEW**
Largest circulation of any publication devoted entirely to Patents.
**Send for a copy at once.**

WHEN you need new equipment or supplies for your machine shop

**Consult this Directory**

¶ You'll find listed here the reliable makers of the lines you need; firms who believe in the progressiveness of present-day manufacturers and who appeal to their intelligence through their own engineering journal.

¶ Consult Canadian Machinery Buyers' Directory and you can't go wrong in your buying.

**Trucks, Lumber and Kiln.**

# CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS--Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5.00 per line a year is charged to non-advertisers.

# High-Grade Malleable Castings
## OF ALL SIZES AND KINDS
## Galt Malleable Iron Co., Limited - - Galt, Ontario

# No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.
Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.
*How to use Stevens' Stopper, or Circle Cement:*
Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings, and that means the saving of your dollars.
Another thing—I do not ask a fancy price for it.
A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

## FREDERIC B. STEVENS
Manufacturer of
Foundry Facings and Supplies, Buffing Compositions and Platers' Supplies

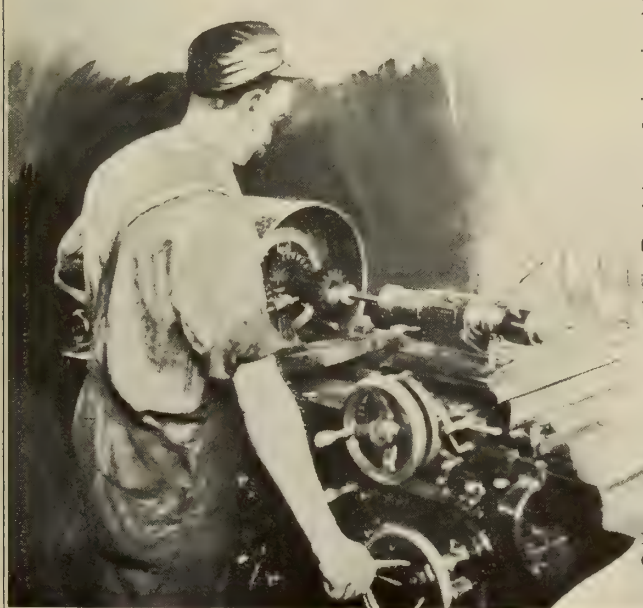
**SO NOW THEY ARE USING ALOXITE GRINDING WHEELS**



ALOXITE Wheels and three other makes were set to work at internal grinding hardened steel gears in a Cincinnati plant.
The work was done dry—removing fifteen-one thousandths-inch stock —the finish had to be "first class" —the work accurate
The Aloxite wheel cut faster, held its shape better, showed greater durability, gave a better finish—so now they are using

# A Jewel— and its case.

The Starrett vernier caliper is to the machinist what a diamond is to a woman—a thing to be prized and admired.

But it is more than that—it is **the** instrument to be used when making fine measurements. With the vernier, readings can be made to .001 of an inch on either inside or outside measurements.

The chief feature of superiority in the Starrett vernier caliper is the quality of the graduations. These are clean, deep and sharp — important when using the vernier on fine work. Prove this yourself under a microscope.

The case for this tool is furnished without additional cost. It is plush lined and finely finished—a perfect case for a perfect tool.

Prices at any hardware store are as follows:

# CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by the MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

Vol. XIII | Publication Office: Toronto, April 1, 1915 | No. 13

HOLES ,, NOT DRILLS

The only test of a drill's true worth is the number of holes it will drill between grindings and the number it will produce before it is scrapped ,, Wisdom and economy in the purchase of drills demand consideration of the service to be rendered.

Cleveland Drills and Reamers are much less expensive in the long run for they excel in hole production and after all, what you want is holes , not drills.

A comparative test will convince you.

# Are Hack-Saws a Nuisance in Your Shop?

They *were* fast becoming a nuisance in our tool works. Men complained of saws breaking easily, dulling easily, teeth stripping, and of all the other troubles incidental to the use of hack-saws.

We did a little experimenting and made some hack-saws that we thought were pretty good. Then we did a lot of experimenting on material and processes and we made a line of saws that we *knew* were good and long trial by others as well as ourselves has convinced us that they have no equal. That is why we know that

# Starrett Hack-Saws Will Solve Your Problems

This is not the appeal of a company which must sell hack-saws to live. It is the plain statement of a company big enough and old enough to know better than claim anything which it cannot make good. We *are* sure of these Starrett Hack-Saws and we want you to try them, whether you do it because we ask you to, or because our name is on them, or because they are recommended by someone to you. Once give them a chance to prove their worth and you can forget the hack-saw situation after that, except for reordering as more are needed.

Special tungsten steel, a secret hardening process and a perfect method of setting the teeth are the reasons for Starrett hack-saw superiority.

# Painting 18-pr. Shells

## Three Coats— per shell— per minute

The amount of net profit in the manufacture of shells depends upon the use of the most efficient machinery and methods in every detail.

The painting machine illustrated here was designed originally for use in the production of shells at our Toronto factory. It has worked so successfully in our own shops that we have placed it upon the market.

The machine is very simple and consists of revolving table provided with six spinning sockets. The shells are set in these sockets and revolved at 250 r.p.m. One man sits beside the machine and does the painting while his helper replaces the painted shells with fresh ones and turns the table by hand to bring a new shell in front of the painter as soon as he finishes the one he is working upon.

# Development of Our Nickel-Copper Smelting Industry

*The European War has brought this particular industry very much into the limelight, on which account information relative thereto is of more than ordinary interest and moment. The two immediately preceding articles dealt with the Mond Nickel Co. smelting plant features. In the present instance, a brief account is given of the Company's refining plant in Wales, and, in addition, considerable light is thrown on the value of nickel as a commercial, naval, military and domestic utility. The information given is more or less official.*

## MOND NICKEL CO. REFINING PLANT.

BEING a purely British corporation, and in view of the fact that the ore is mined and smelted in Empire territory by the Mond Nickel Co., it is only natural to expect that the refining or ultimate process, whereby the nickel product becomes a marketable commodity, should also take place within the like bounds.

### Refining Works at Clydach, Wales.

The Bessemer matte is shipped from the company's smelters at Coniston via the Canadian Pacific Railway or the Canadian Northern Railway to Montreal, and thence to Swansea, Wales, near which port the company's refining works are situated. Here the matte is refined by the Mond Nickel or Nickel Carbonyl process. Five operations in all are required to produce the nickel:—

1.—Roasting to free the matte from sulphur.

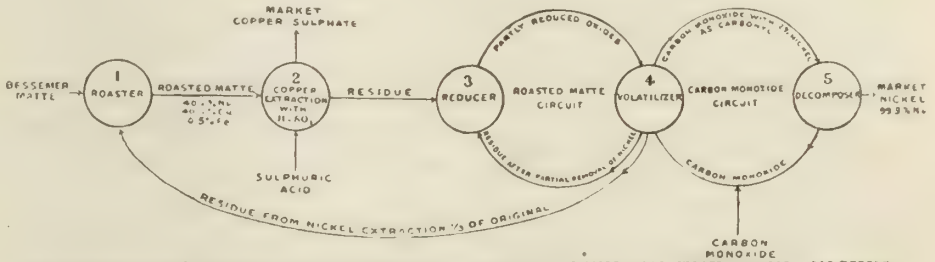
2.—Extraction of two-thirds of the copper by sulphuric acid.

3.—Reduction of the nickel and remaining copper by water gas rich in hydrogen at a temperature not higher than 400 degs. C.

4.—Treating the reduced matte in an apparatus called a "volatiliser," by carbon monoxide at a temperature not exceeding 80 degs C.

5.—The nickel-carbonyl gas produced by the previous operation passes into a "decomposed" in which it is heated to 180 degs. C., when the nickel is deposited in metallic form.

The following diagram illustrates the five operations involved in the Mond process:—



ILLUSTRATING THE FIVE OPERATIONS INVOLVED IN THE MOND NICKEL REFINING PROCESS.

The process is not completed, however, by one passage through the five stages, as only about 60-70 per cent. of the nickel has been removed from the matte by the nickel-carbonyl gas. The residue from this operation, which does not differ very much in its composition from the original matte, is returned to the first operation and follows the same course as before. In operation 5, the carbon-monoxide is released and returned to the "volatiliser," to take up a fresh charge of metal. The nickel is deposited on granules of refined nickel, which are automatically removed after they have grown to a certain size.

The product obtained contains between 99.8 per cent. to 99.9 per cent. of nickel, not including cobalt, and is the purest form of nickel which is at present obtainable in commercial quantities. The process is a continuous one, and large quantities of coal are required for it, full advantage being taken of the situation of the refining works, which are in the midst of the Welsh anthracite and steam coalfields. It is therefore possible to secure at very low cost the necessary supply of coal which in the process is largely used for power, steam and gas. The products made in the process are:—

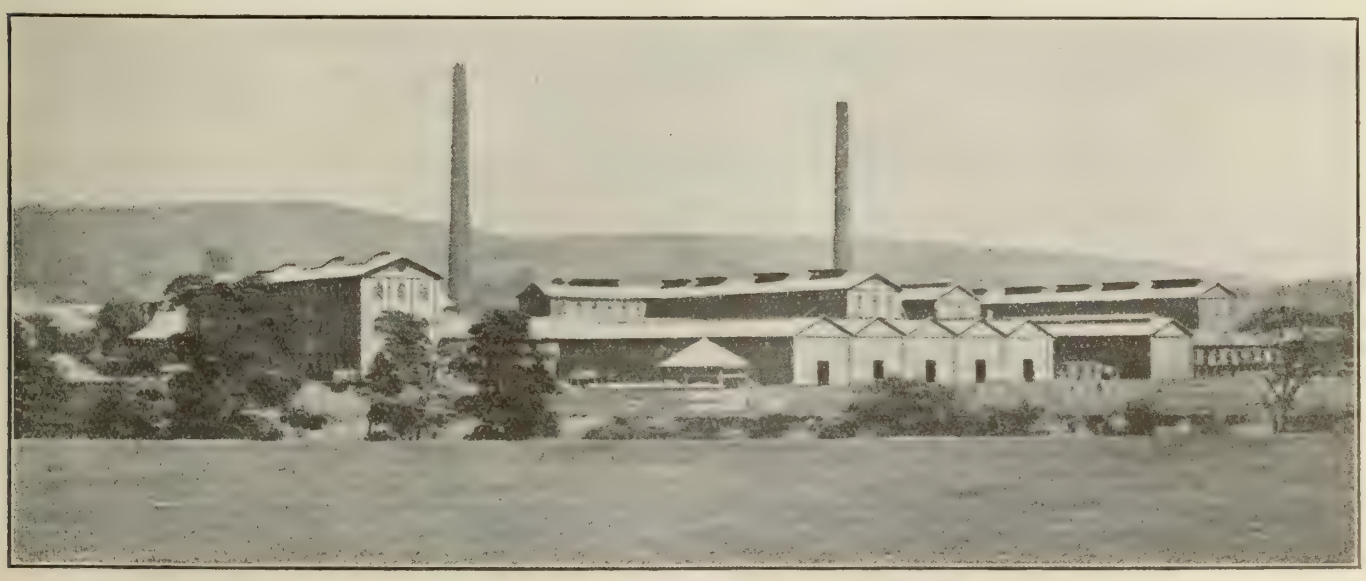
1.—Sulphate of copper.

2.—Nickel.

3.—Nickel salts.

### Copper Sulphate.

The copper sulphate is shipped from Swansea to Italy, France, and Spain, and other wine-producing countries, to be used for spraying the vines, in order to prevent mildew and other fungoid diseases. It is recognized that the spraying of sulphate of copper is the only preventative against these diseases. Copper sulphate is also used for prevention of



MOND NICKEL CO. REFINING WORKS AT CLYDACH, WALES.

diseases in other plant, for spraying potatoes, olive-trees, for killing weeds, etc.

### Nickel Salts.

The nickel salts manufactured by the company are largely used in the nickel-plating industry, and also as a catalyser for fat-hardening purposes.

### Company's Village at Clydach

The Mond Nickel Co. have done much in the interest and comfort of their employees. With this object in view they erected a model village near the refining works at Clydach, where comfortable and distinctive accommodation is provided for the workmen and their families.

The social activities of Clydach Village centre round its club, which was opened in January, 1909, and that it has fully justified its existence is shown by the fact that it can boast of over 500 members. The club house itself was built by the company at a cost of nearly $20,000, its main feature being a large concert hall with seating accommodation for 450, wherein fortnightly concerts are held throughout the winter. Admission is free and members are entitled to introduce their friends. There are also a billiard room with two tables, and air-rifle range, a photographic dark room, a reading room, a refreshment room and the usual committee rooms.

In the club library, which is well stocked with excellent works of fiction, biography, travel, science, etc., there are more than 1,000 volumes from which members can make their selection, while, in the reading room, technical publications, the leading daily newspapers, as well as weekly and monthly journals, are provided for their entertainment.

The Clydach club is not limited by four walls, its activities extending far beyond the actual club house. For instance, affiliated to the club are football, cricket, hockey and curling sections, and members of a musical turn of mind have an opportunity to display their talents in the brass band, orchestral, or male voice party sections. In addition, the club has a photographic section, not to mention a flourishing gardening society, in connection with which a flower show is held every year. In fact, every employee at the Mond Nickel Co. Refining Works at Clydach is pretty sure to be able to find in the club some opportunity for the gratification of his particular tastes in whatever direction they may lie.

### Uses of Nickel.

The uses of nickel are so many and are multiplying so rapidly as to be almost innumerable, and although the importance of pure nickel is growing daily, the chief use of the metal is in the production of alloys, particularly nickel steel, in which the greater part of nickel refined is still employed. The alloy of nickel and iron is no novelty, since all native iron of terrestrial as well as meteoric origin contains nickel. Moreover, as far back as 1822, experiments were made by Faraday in alloying nickel and iron, and since then improvements in the process have been made continually.

### Nickel Steel.

Nickel steel has many uses and is constantly finding new applications. Steel containing from 2½ per cent. to 3½ per cent. of nickel has certain of its properties greatly improved, so that in many directions it is replacing ordinary structural steel. The following table, which shows a comparison of carbon and nickel structural steels gives some idea as to its superiority:

| Characteristics. | Med. Carb. Strength | Med. Nickel Steel |
|---|---|---|
| Percentage of carbon | 0.20 | 0.38 |
| Percentage of Ni | 0 | 3.50 |
| Elastic limit (lbs. per sq. inch) | 30,000 (Min.) | 60,000(Min.) |
| Ultimate strength (lbs. per sq. inch) | 60,000 (Min.) | 105.000(Min.) |
| Modulus of elasticity | 29,000,000 | 30,000,000 |
| Safe working stress in tension (lbs. per sq. in.) | 16,000 | 28,000 |

Perhaps the most important use to which nickel is put is for the manufacture of armour and heavy ordnance, where its great strength and toughness have proved of great value. It has been used for engines and propeller shafts for

OFFICIALLY TESTED ARMOR PLATE FOR BATTLESHIP—MADE BY SIR. W. G. ARMSTRONG, WHITWORTH CO. MOND NICKEL USED IN MANUFACTURE.

a number of years and has proved so much superior to other steels that it is now considered unrivalled for such purposes. On account of the increase in strength or decrease in weight, it has been used for crank pins, light forged engine frames, bolts for extreme hydraulic pressure, hydraulic forged cylinders and railway axles. From its peculiar resistance to fatigue under vibration, it is employed very successfully for piston rods in steam engines and drills.

The value of nickel steel for armour plates, when cemented and face-hardened, consists not only in its greater resistance to penetration, but in its non-fissibility. So completely is this recognized, that since the Washington Navy Yard first began experimenting with nickel steel in 1876, every country in the world has come to rely on nickel steel for the armour-plating of its first-class ships of war. Incidentally, it may be mentioned here that nickel prepared by the Mond Nickel Co. is largely used in the manufacture of armour-plates for the British Government.

### Nickel Steel for Bridge Building.

There is also an increasing demand for nickel steel for the building of bridges. Nickel steel is being used for the rebuilding of the Quebec bridge which collapsed so disastrously a few years ago. It also entered largely into the construction of the Manhattan bridge at New York. This is the heaviest suspension bridge in existence, and for its length the heaviest bridge of any kind in the world. Although its span is 140 feet less than the span of the big cantilevers of the Forth Bridge, the enormous load which the bridge is designed to carry calls for a weight of cables and suspended superstructure that makes it by far the heaviest and strongest bridge yet constructed.

The suspension bridge proper, disregarding the approaches, consists of a main span 1,470 feet long and two side spans, each 725 feet in length. The total width of floor is 120 feet. A novel feature is the use of nickel steel in the upper and lower truss chords, which are subjected to a working stress of 40,000 lb. per square inch. The nickel steel rivets are subjected to a working stress of 20,000 lb. per square inch, and notwithstanding the higher cost of the nickel steel, the saving in weight is such as to make the trusses actually cheaper than if they were built entirely of ordinary structural steel. The weight of steel in the superstructure from anchorage to

anchorage exclusive of the cables, is 10,500 tons of carbon steel and 8,000 tons of nickel steel. The weight of the cables is 6,300 tons and the total weight of steel in the whole bridge, including anchor chains, cables, towers, and suspended span, is 42,000 tons. The following table shows the approximate saving in weight and cost of bridges effected by the use of nickel steel:

Mixed nickel and carbon steel—saving in weight up to 25 per cent; saving in cost up to 17 per cent.

Nickel steel throughout—saving in weight 10 to 30 per cent.; saving in cost up to 12 per cent.

### General Uses.

Nickel steel is especially suitable for motor car parts, because it possesses high tenacity and is very durable and has a remarkable co-efficient of expansion. For this same reason it is particularly well adapted for steel rails, and in places liable to special stress it is much used. For instance, it is estimated that in a sharp curve one nickel steel rail has a life as long as that of four rails made of ordinary steel.

Nickel steel is also used in wire cables, torpedo defence netting, electric lamp wire, corset wire, mountings of lenses, mirrors, balances for clocks, weighing machines, springs, cutlery, harness mounting, boiler tubes, axles, brake-beams and transoms for field artillery wagons as used by the French Army since 1898.

### Currency

A great many countries have adopted nickel or nickel alloy for the manufacture of small currency, for the reason that only nickel and nickel alloy completely fulfil the requirements of such currency. The metal used must be comparatively cheap, of handsome appearance, not liable to oxidation or alteration by any chemical agent; and it must be not too difficult to mould, roll, punch and stamp; be capable of taking a good impression of the die, durable in wear and difficult to counterfeit.

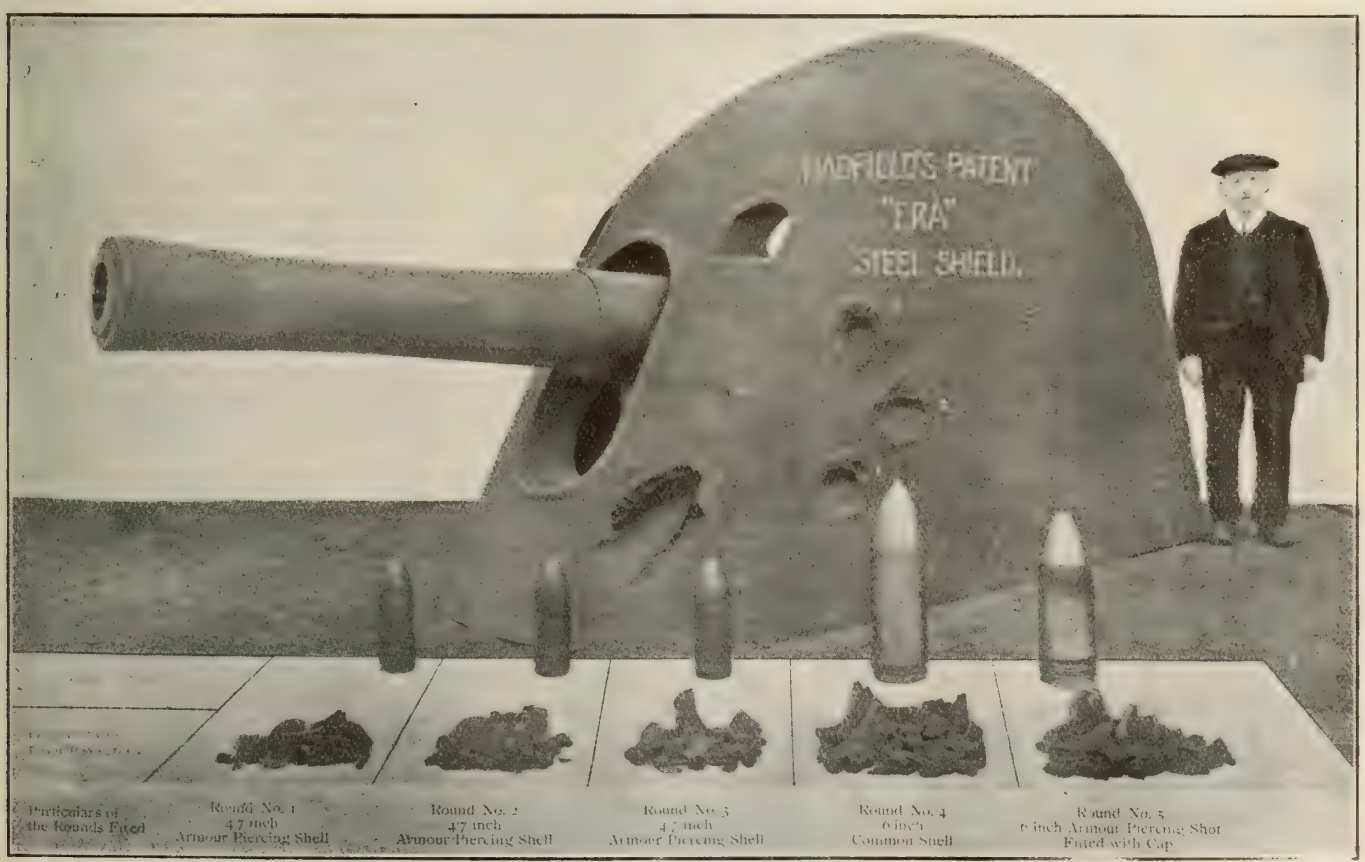
OFFICIALLY TESTED ARMOR PLATE FOR BATTLESHIP—MADE BY SIR. W. G. ARMSTRONG, WHITWORTH CO. MOND NICKEL USED IN MANUFACTURE.

Formerly, pure copper was most frequently used for the commoner coins in nearly all countries. It is cheap and easy to work, but very liable to oxidation and too soft. Moreover, the risk of counterfeiting can scarcely be avoided, as copper can be had everywhere and offers no difficulty in working.

Bronze has also been tried in order to enhance the hardness of copper, but the coins of this alloy suffer from nearly all the disadvantages of those made of pure copper.

German silver, which is an alloy of nickel, copper and zinc, has been used for coins in various states of South America, but although better than copper and bronze, it oxidizes too readily and soon loses its bright appearance. German silver, with an addition of pure silver, was tried by the Swiss Government, but the coins made of this alloy soon became yellowish and unsightly, and Switzerland has since adopted pure nickel and nickel alloy for its coinage.

Small copper coins coated with silver have been used in many countries, but the silver coating soon wore off and the appearance of the coins became so paltry



HADFIELD'S PATENT

and the dirt stuck to them to such a degree that many countries in which they were in use discarded them altogether.

The first experiments with alloys of nickel and copper were made in the United States and Belgium. The compositions varied from 10 per cent. nickel and 90 per cent. copper to 50 per cent. nickel and 50 per cent. copper. In both these countries and later in several others (including Germany) it has been proved that an alloy of 25 per cent. nickel and 75 per cent. copper possesses to a high degree the qualities desirable for material for small currency. Coins of this alloy being harder than bronze, the material being much dearer, and greater skill and a powerful plant being required to work them, it is practically impossible for counterfeiters to produce imitations with any chance of success.

It is only a few years ago that a process was discovered to roll, hammer and stamp pure nickel, and already the governments of Austria-Hungary, Italy, Switzerland, Denmark, Montenegro, Mexico and other countries are being supplied with coins of this metal. These coins are the most excellent that have ever been made, are most durable in wear, they never oxidise and it is simply out of the question to endeavor to counterfeit them successfully. How widespread is the use of nickel and nickel alloy for small currency can be seen by the following table of the countries which have adopted nickel coinage:

| | |
|---|---|
| Argentine | Japan |
| Austria-Hungary | Jamaica |

### Kitchen Utensils.

The remarkable properties of nickel, which approaches the precious metals in its chemical powers of resistance, while far exceeding them in hardness and toughness, have in later years led to its employment, firstly for cooking utensils and kitchen ware, and secondly in an ever-increasing degree, for cookers, dishes, basins, baths, crucibles, stills and hollow vessels of every description used throughout the technical arts.

Indeed, as a metal for cooking utensils, nickel is the ideal. Tinned or "tin" vessels (sheet iron coated with tin) are mostly thin and very liable to injury, while enamelled vessels have the great drawback that the enamel coating is liable to chip. Thus, when damaged enamel utensils are used the food comes into contact with the iron and is apt to acquire a metallic flavor. There is also the great danger of detached chips of enamel being swallowed with the food.

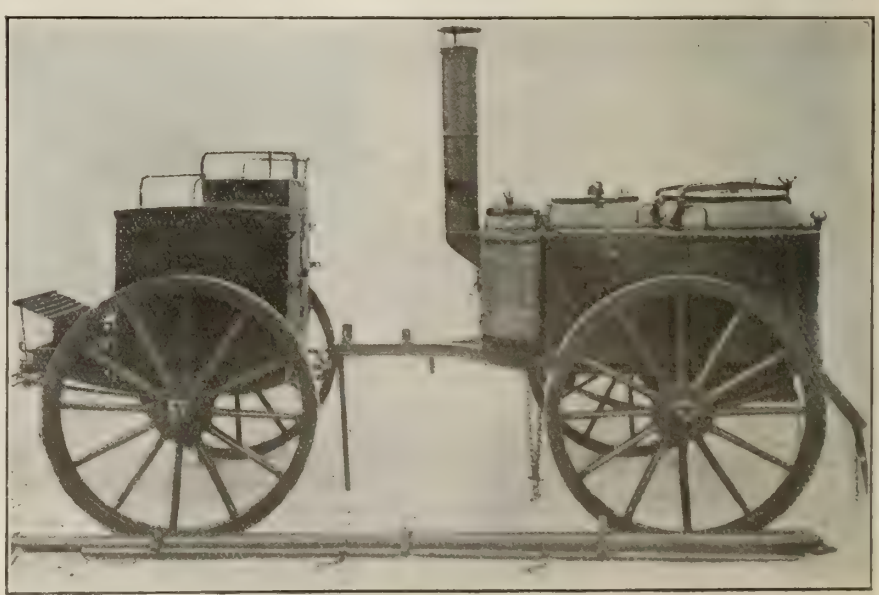
Copper cooking utensils undergo strong oxidation, and can only be used provided they have a thick inside coating of tin. This coating wears away very rapidly and has often to be renewed; thus there is always the danger of the formation of poisonous copper salts which dissolve in the liquid food. Copper utensils under any circumstances mean a great deal of work for the kitchen staff, for every time after use they must be not only washed, but scoured to remove the discolorations caused by the fire. One of the main advantages of the use of nickel kitchen utensils is that they do not require tinning.

ARMY COOKING CHEST MADE OF PURE NICKEL.

Nor do cooking utensils made of aluminum provide a satisfactory substitute for copper or iron. The melting point of aluminum is comparatively low, so that it is extremely sensitive to the action of heat, and vessels of aluminum unfilled with water frequently melt if they are put on a strong gas flame or fire. Moreover, the constant recurrence of a dull gray layer of oxide necessitates constant scouring; and aluminum, being exceedingly soft, requires specially careful and delicate handling in this operation. Aluminum is also dissolved in liquid food and forms metallic salts which may sometimes be poisonous.

ARMY FIELD KITCHEN—INTERIOR FITTINGS OF PURE NICKEL.

All the dangers and disadvantages enumerated are entirely absent from nickel utensils. Pure nickel does not oxidise like iron, copper or aluminum; it is harder than these metals, and is therefore much more durable; it may be, therefore, described as positively indestructible. Pure nickel utensils, moreover, when worn beyond possibility of further service, still retain a high metal value.



ARMY FIELD KITCHEN—INTERIOR FITTINGS OF PURE NICKEL

### Field Kitchen Appliances.

From the ordinary barrack's cooker, it is only a short step to the manufacture of field kitchen appliances, for, owing to the great strain and rough treatment to which military cooking appliances are exposed, they must be made of a material:

(a) — Which possesses sufficient strength and durability to withstand even the rough handling inevitable in the field.

(b)—Not liable to injury, even if the cooker be wrongly heated—i.e., when empty or insufficiently filled.

(c)—Which is faultless from a hygienic standpoint, and precludes every possibility of injury to health.

(d)—Which does not require repair in field such as would inevitably happen with copper and iron, owing to the necessity of re-tinning.

Pure nickel alone is capable of responding to these varied requirements. The field-kitchens for military purposes are designed in such a way that they can prepare the food for 250-260 men in the course of a few hours, even during marches.

A further article for the efficient feeding of troops, especially mountain troops, is the cooking-chest. This consist of a pure nickel field kettle of about 5.72 gallons capacity, together with an iron under-frame for heating. The kettle and hearth or under-frame telescope into each other and are put into a chest made of veneered wood, lined with asbestos straw, oil-paper and cork. The chest is fitted in such a way as fully to retain heat. Some hours before the meal is required, the food is heated to boiling temperature, and the kettle is then put into the chest; the latter closed and mounted on the saddle, and during transport the food becomes thoroughly cooked. The design of the chest is so ingenious that after 18 hours with an outside temperature of 30 deg. F., the food is still found to have a temperature of 182 deg. F.

## EXPERIENCES IN ELECTRICAL MACHINERY OPERATION.*

By E. C. Parkham.**

WHEN an a.c. generator supplies underloaded transformers and induction motors, the current of the generator lags behind its e.m.f. Under this condition more exciting current must be furnished by the exciter if the alternating voltage is to be maintained at normal. (The effect of lagging armature current is to cause the magnetizing action of a given armature coil to oppose the magnetizing action of that field pole which it is opposite. This decreases the resultant field cut by the armature conductors so that they do not generate as high an e.m.f. as they do when the voltage and current are in phase and the opposing armature reaction is at a minimum. In other words, a lagging current tends to demagnetize the field poles, and, if normal voltage is to be maintained; the field strength must be restored by increasing the amount of current drawn from the exciter.)

*General Electric Review.

**Construction Department, General Electric Co.

### Exciter Commutation Trouble.

An operator complained that his exciter commutated badly and that he was unable to keep up the voltage on the alternator. These two symptoms in themselves suggested that an overload was the trouble and excessive heating of the exciter confirmed this suspicion. Since the exciter circuit included no ammeter its output was not shown. An inspector cut in an ammeter which indicated the exciter to be continuously overloaded 40 per cent. The operator then stated that the exciter was guaranteed to maintain normal a-c voltage at 0.8 power-factor and that his power-factor was better than 0.8. Rough calculations based on station wattmeter, ammeter, and voltmeter readings showed that the power-factor was between 0.55 and 0.60 at the time of the readings. The operator was well enough satisfied with these results to substitute a larger exciter for the work.

### Hot Box Indications.

If trouble of any kind occurs in layouts that involve electrical apparatus it is usually the case that some one of the electrical devices is promptly blamed as being the cause. Apparently it never occurs to many operators that troubles may arise from abnormal conditions in the connected load.

In a certain instance an operator complained to the power company that the voltage supplied was varying widely and was causing speed variations in an induction motor that was driving a centrifugal pump. The power company failed to see how this could be possible but, to satisfy the consumer, applied a recording voltmeter, which showed the voltage to be well maintained. On looking further for the trouble, it was found to be due to a hot box on the pump shaft; the box would alternately bind and release, thereby causing the motor speed to vary according to this variable load which was imposed upon its regular load. (The operator should have observed that voltage variations could not have been the cause of trouble because other induction motors on the same service were not affected.)

A short time afterward, the same pumping unit, after working all day, refused to start on closing the control switch the next morning. The panel starting-contactor closed promptly, but operator reported the motor was "dead." It took an inspector about five minutes to find out that there was nothing wrong with the motor. On turning the rotor back to let out the back-lash due to the belt coupling, and closing the control switch, the rotor promptly took up the back-lash, but refused to rotate further. An investigation showed the trouble to be in the same pump bearing that had given trouble before; it was now frozen tight. A new lining, plenty of oil, and a smooth shaft remedied matters.

### Burn-Out Due to Core Loss.

A solid iron core would offer such a low resistance to the eddy currents set up by the core cutting the magnetic lines of the field that these currents would be very large and cause prohibitive heating. Laminations, when insulated from each other, introduce resistance, and thereby reduce the volume of current in the core to a very small value.

A certain armature had been burned out by the power current that followed a lightning discharge to the core. The damaged coils were removed, the core cleaned and scraped, and new coils installed. The machine ran without trouble for several months and then burned out again in the same place. Attributing the second failure to poor repair, about twice as many coils were removed as before and the machine again repaired. Before it had a chance to fail again, the operator had a whiff of burning insulation investigated and found excessive heating, which was confined to the repaired area.

An "armature man" was called in. On removing the repaired coils, inspection disclosed that the insulation armor of some of them was being burned from the outside; the cotton insulation on the wires was in good condition, showing that the trouble did not come from within. The armature was stripped, the core disassembled to and including the burned area, several inches of new laminations installed, and the coils replaced. On drying out and again placing the machine in service, no tendency to heat more in one place than in another was exhibited.

The cause of the heating had been the burning together of the laminations; the effect was equivalent to having a part of the core made of solid iron.

**New Westminster, B.C.**—John and Harry Shull, the managing directors of the Shull Shingle Mill Co., which is building a large plant on the North Arm of the Fraser river in Burnaby, are making final arrangements for the operation of the mill, which they anticipate opening by June 1.

# Machining Shrapnel Shell Cases, and the Tools Employed

By J. Thompson

*Just as there is a wide distribution of orders for the machining of 18-pounder shrapnel shell cases, in like manner is there more or less diversity in method and procedure adopted relative to their quality and quantity output as finished products. A thoroughly practical demonstration of how to achieve the desired end profitably is given in accompanying article.*

THE importation of tools and equipment with which to prosecute the manufacture of British 18-pounder shrapnel shells has been one of the outstanding features which has

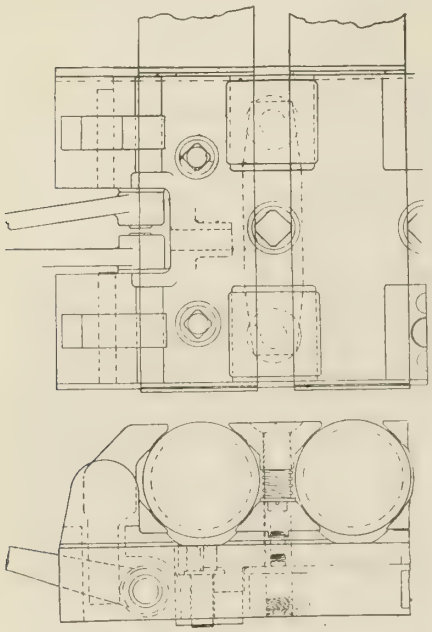


FIG. 1.

marked the prodigal quantity distribution of shell orders to Canadian industrial concerns since the advent of the European War. The present article deals with the machine tool equipment designed and manufactured by the Potter & Johnston Machine Co., Pawtucket, R.I., of which many Canadian firms have installed units more or less liberally.

### First Setting, Forged Shells.

Six or more shells are placed in a fixture fastened to the table of an automatic milling machine, the method of holding, and type of fixture used, being as shown in Fig. 1. There is a continuous cutting-off and milling of each end on account of there being two tables on the machine. The method of placing the shells in the fixture to insure their being of one length is obtained by the use of a gauge prior to the shell being tightened down in fixture. Two shells are set at once and the gauge slides on the side table. Fig. 2 shows the side view of the gauge, and Fig. 3 a sectional view of the fixture. While one table is in operation the other is being emptied of its finished work and rough material put in. The next step is to place a shell on the expanding pin arbor, and by means of a drawback mechanism, it is held true with the inside. The driving is done by means of a binding screw, which presses down on the shell exactly over one of the pins. Fig. 4 shows the method of holding.

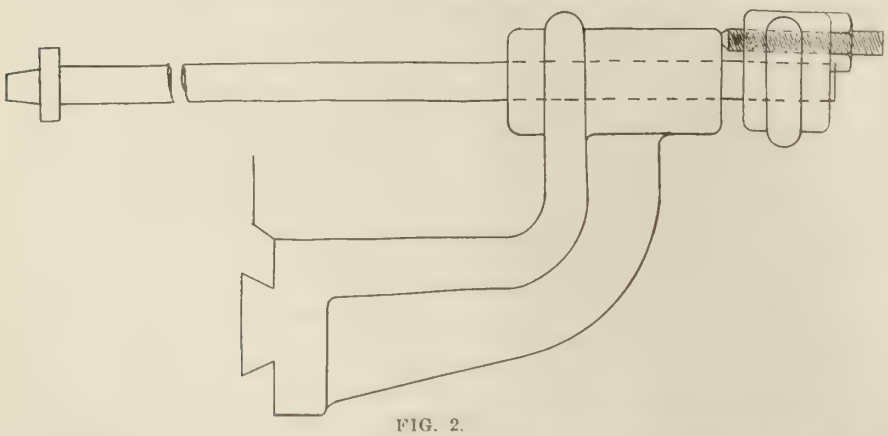

FIG. 2.

The next operation is the rough turning of the shell—approximately 7¼ in. long. At the same time, the end of the shell is faced off to length by means of an end mill inserted in the turret. Removal of excessive stock by this end mill is the cause of lots of trouble and care should be exercised in the cutting off on the milling machine. Fig. 5 shows the holder fastened on to turret with the end mill in place.

The next turret face is used for finish-turning of the body as far as the wave or at most, ⅛ of an inch beyond. Also, while finish-turning this body part, the radius is put on at the same time. Fig. 6 shows the holder with the radius and turning tool in position.

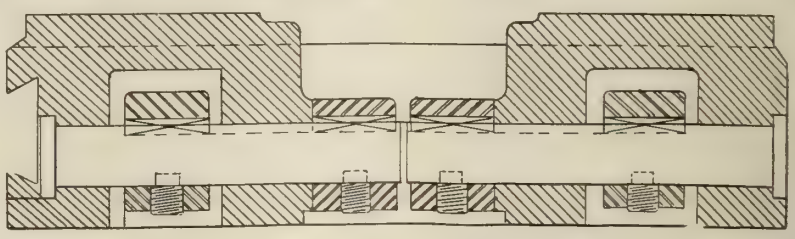

FIG. 3.

The next operation is the under-cutting and dove-tailing. The under-cutting tool is held on the cross slide block, the cross slide operating longitudinally with the turret, and operating by means of a separate cam and a separate drum. This cutter passes under the shell, and, by this means a correct size is always secured. Fig. 7 shows the cutter held in the block. While this cutter is in operation, it is necessary to hold it rigidly, and this is done by means of a revolving ball-bearing thrust collar held in the turret.

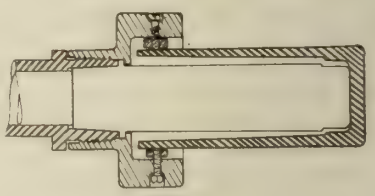

FIG. 4.

At the same time as this under-cutting is done, the dove-tailing is put in. The dove-tailing tool is fastened on the turret face, and the small slides are operated by means of a push-block which is fastened on the cross slide block, Fig. 7. These small slides are set in the block or holder at the required degree, and the cutters of the hook nose type are fastened in these slides, and are adjustable (back and forth). Great care must be exercised in the setting of these tools, as the least little dis-adjustment will cause the shell to be rejected on ac-

FIG. 5.

count of the slot being too wide. To get the required depth of dove-tail, adjusting screws are fitted. Fig. 8 shows the method of cutting the dove-tail in shell.

After the under-cutting and dove-tailing is finished, the waving is cut in.

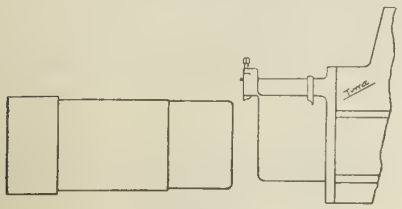

FIG. 6.

This waving is done by means of a bar sliding in a block which is fastened on the cross-slide, Fig. 9. At the end of the sliding bar there is a roll which runs up against the face of the scroll fastened on the spindle nose. This scroll or spindle nose cap has the correct wave

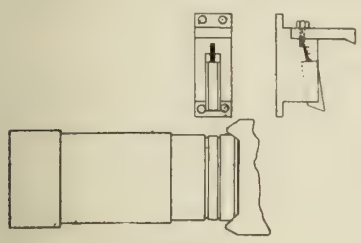

FIG. 7.

cut in it, and the roll is kept up against the face of the scroll by means of a spring inserted in the under part of the sliding bar.

There is always tension on this spring and more so when the roll is up against the scroll face. It is necessary to have

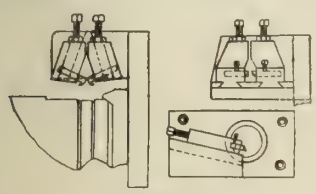

FIG. 8.

this spring quite strong to insure a perfect wave on the shell. The cutter is held in the sliding bar and is made with two small recesses or vees. It is adjustable and set at an angle, and can taken out and ground and put back without much trouble. While this cutter is in operation, it is necessary that the shell

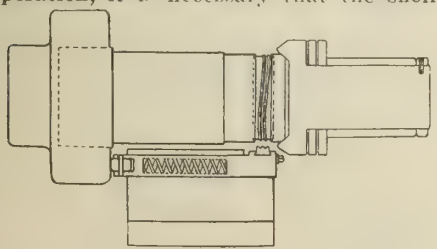

FIG. 9.

be held rigidly and this is obtained by means of a revolving, thrust-bearing washer.

All of these tools constitute the first setting for machining the shell, a general lay-out of the tools being shown in Fig. 10.

**Second Setting, Forged Shells.**

For the second setting, the shell is

SHELL
EXPANDING PIN ARBOR
REVOLVING SUPPORT FOR END OF SHELL
UNDER CUT TOOL FOR ROUGHING GROOVE
RELIEVING TOOL WITH ROLLER SUPPORTS
REAR CROSS-SLIDE UNDERCUTTING TOOL ALSO OPERATES DOVETAIL TOOL CARRIED ON TURRET.
RELIEVING TOOL

FIG. 10. TOOL LAYOUT, FIRST SETTING FOR MACHINING SHRAPNEL SHELL FORGINGS.

placed in a collet chuck operated by a drawback mechanism. This collet is

FIG. 11.

ground out in the machine, thereby insuring the shell to run positively true. It is gripped substantially and with no possible means of slipping. The shell being in place, the first turret face holds the boring bar for boring out the powder pocket. At the same time, the shell is

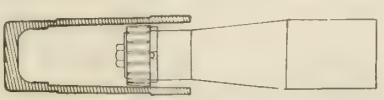

FIG. 12.

turned at the open end to a diameter larger than that of the body in the previous operation. The turning tool holder is fastened on the turret. Fig. 11 shows the boring bar and turning tool.

The next operation is the boring out of

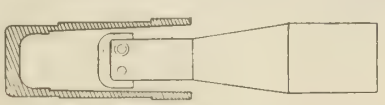

FIG. 13.

of the diaphragm seat. This is done by means of a fluted reamer which is taper. Fig. 12 shows the reamer in place for machining the seat. At the same time as this seat is machined, the taper is cut as well. The next operation is the finishing of the powder pocket, Fig. 13.

The next operation is the taper turning on the open end of the shell, or forming the end preparatory to the nosing in. The taper turning is done by means of a tool fastened in a block on the cross-slide. The push-rod works the opposite way to the tool, and is operated from the turret, to which is fastened a steel block.

In some cases it has been found necessary to use a large reamer for reaming

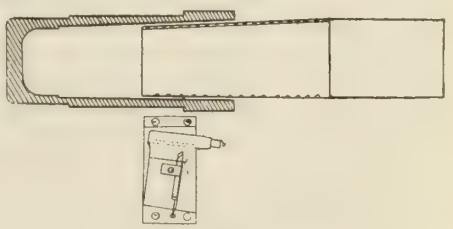

FIG. 14.

out the inside of the shell to get the correct weight. This is done by means of a large taper reamer fastened in the turret, working in conjunction with the

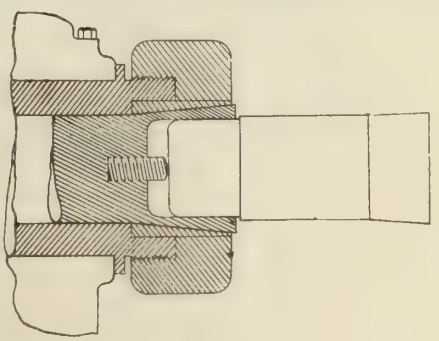

FIG. 15.

taper turning tool. Fig. 14 shows the taper turning tool and reamer in position, and Fig. 15 the method of holding

the shell. All these tools constitute the second setting and Fig. 16 shows the lay-out of tools.

Before the third setting, the shells

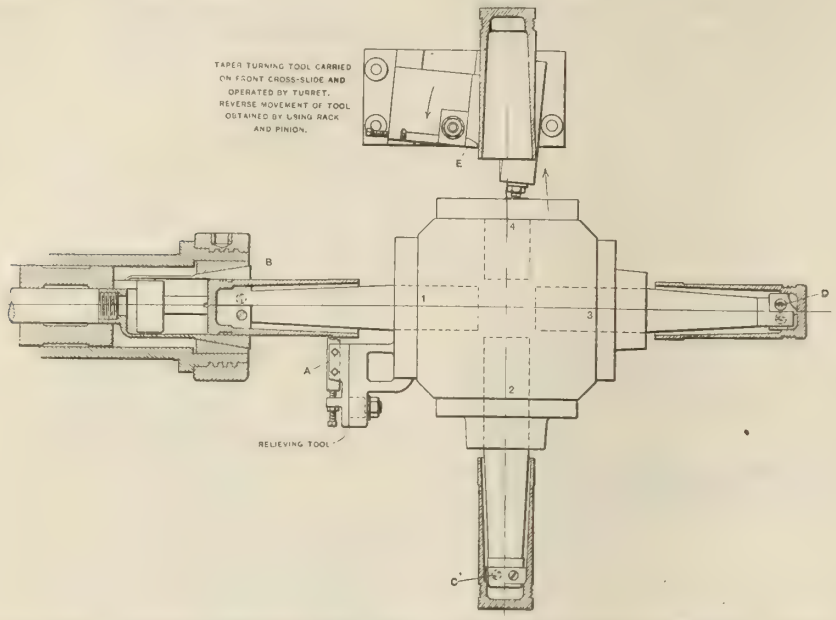

FIG. 16. TOOL LAYOUT, SECOND SETTING FOR MACHINING SHRAPNEL SHELL FORGINGS.

are sent to the heat-treating department to be hardened, and great care has to be exercised in this feature in regard to Government requirements for strength. Following this comes the nosing-in. The shells are placed with the open end in a lead bath and heated, and the nosing-in is done by means of a press and a formed die.

For the third setting, the shells are held in place by means of a collet chuck gripped further along the body than in the second setting. The first turret face constitutes a rough boring bar which holds the roughing cutter and a finishing cutter as well. The face of the shell is also finished by means of a flat cutter inserted in the bar.

The second turret face consists of a forming boring bar operated by means of a formed block fastened on the cross-slide. The second turret face is used for rough forming the inside one inch from the back of the thread.

The third turret face is used for finish-turning the form one inch back from the thread, while the fourth turret face is used for threading, a collapsible tap being used. Fig. 17 shows the method of holding and the lay-out of tools. The foregoing constitutes the machining of 18-pounder shrapnel shells from forgings.

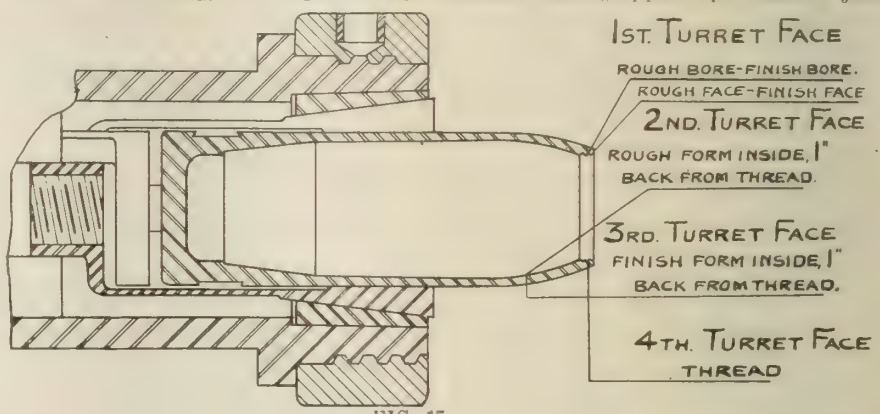

FIG. 17.

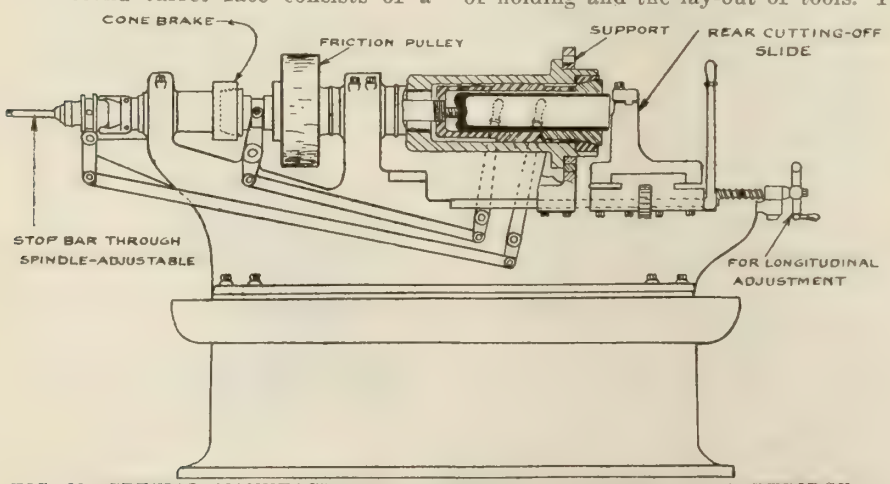

FIG. 20. SPECIAL MANUFACTURING LATHE FOR CUTTING OFF CARTRIDGE CASES.

### Lyddite Shells.

In addition to making the shells from forgings, bar stock is used. The stock is cut off into lengths and gripped by means of chuck jaws fastened on a 16-in. scroll chuck, Fig. 18. The turning, facing end, under-cutting, dove-tailing and waving are done as already described. Fig. 19 shows the method of holding the shell for the second operation, when ap-

FIG. 18.

plied to the manufacture of lyddite shells.

There are two ways of machining lyddite shells and both can be done to good advantage. In the second method, and first setting, bar stock is cut off in lengths, and gripped by chuck jaws. First turret face—rough-turn outsde up to the chuck jaws, rough drill hole and counter bore nose end. Second turret face—rough form nose, bore hole and powder pocket, and rough counter bore. Third turret face—finish form nose and

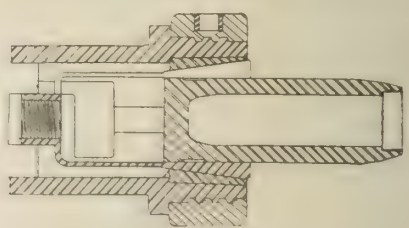

FIG. 19.

finish turn outside diameter, finish counter bore. Fourth turret face—Thread.

Second setting, first turret face—Grip body by means of a collet chuck, rough turn remaining stock, and face end. Second turret face—Finish-turn shoulder base and put radius on closed end.

Third turret face—Under-cut with cross-slide block and dove-tail. Fourth turret face—Wave.

Fig. 20 shows a Potter & Johnston machine for cutting off cartridge cases, one such being shown in process. It is held by means of a collet chuck and operated by a drawback mechanism. Accuracy and trueness are assured as may be noted.

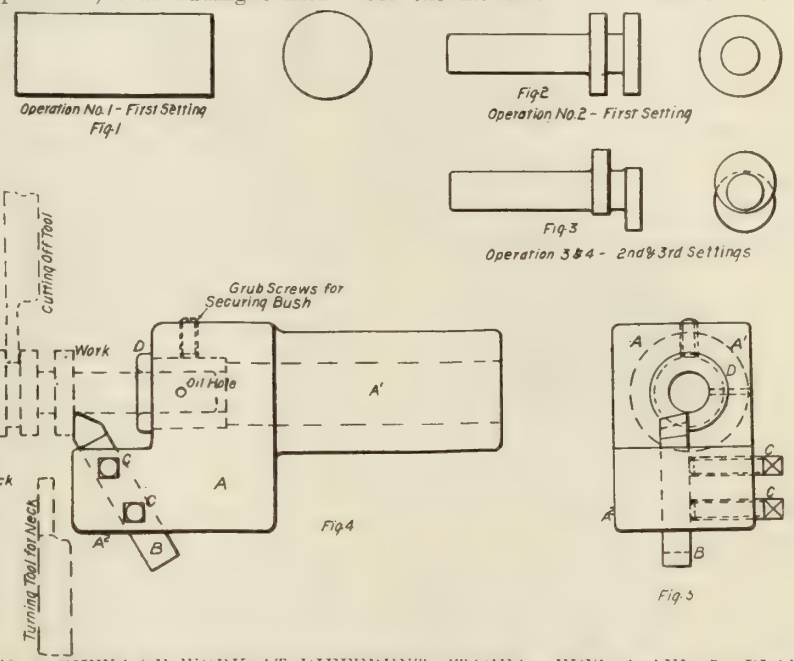
## TOOLS AND FIXTURE FOR MACHINING DOUBLE CAMS.

By W. G.

THIS article is intended to describe a simple method by which a number of small double cams were machined. It may, perhaps, be worthy of mention that the operations in question were carried out on a 6 in. centre capstan lathe, the whole of the machining being performed at two settings. As the number of components required was comparatively small, it was necessary to keep down the initial cost of the tools as much as possible, but, at the same time without going to extremes and producing a set of "shoddy" tools that would in any way impair the output, or quality of the work. Perhaps this point is well worth keeping in view, particularly when designing jigs, tools, etc., for work in small quantities.

With reference to the accompanying drawings, Figs. 1, 2 and 3 are views of the work at different stages. Figs. 4 and 5 are plan and end view respectively of the tool for the second operation, while Fig. 6 is a front and end view of the fixture for the third operation.

The holder A (Figs. 3 and 4) consists of a rectangular mild steel forging, provided at its rear end with a circular shank $A^1$ for the purpose of securing it to the machine. It is further provided at its other extreme with a projection $A^2$ for the purpose of carrying the turning tool B, the latter being secured by means of the set screws C. Part D is the steady bush: This is made from a good quality of cast steel, and should be hardened and ground. It is essential however, that a spiral oil groove be cut the entire length of the said bush, as this allows the work to be properly lubricated when in operation; thus adding considerably to the smooth working of the tool.



FIGS. 1 TO 3. VIEWS OF WORK AT DIFFERENT STAGES. FIGS. 4 AND 5. PLAN AND VIEW OF TOOL FOR SECOND OPERATION.

The third operation (turning eccentrics) is carried out by means of the fixture shown in Fig. 6. Part E is the body of the fixture. This consists of a circular cast iron face plate, provided with two rectangular projections $E^1$ and $E^2$ for the purpose of forming a slideway for the chuck plate F. The latter is made from mild steel, and consists of a flat plate having two of its edges bevelled off as shown to suit the corresponding aperture formed in the said plate. The chuck plate is further provided with a central screwed hole $F^1$ for the purpose of receiving the chuck.

It will be noticed that the front of the said hole is bored out plain, the object being to provide a register or locating recess for the chuck when screwed into the plate, thus providing means for keeping the chuck quite true. The elongated holes $F^2$ and $F^3$ are to allow for the movement of the slide when in operation. Parts G and H are the clamping nuts and studs respectively.

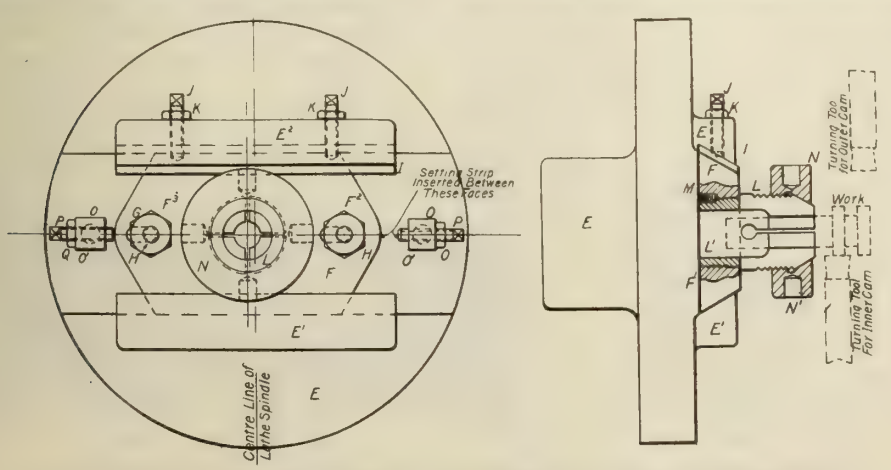


FIG. 6. FRONT AND END VIEW OF FIXTURE FOR THIRD OPERATION.

The adjusting gib I is made from mild steel strip, and is held in position and operated by means of the set pins J and the lock nuts K. The chuck body L is made from a good quality of cast steel, and should be carefully hardened and ground. The one in question is of the ordinary spring type, having four longitudinal saw slits as shown. The reduced screwed end $L^1$ should be left soft, the object being to make provision for finally securing it to the chuck plate F by means of the grub screw M; the drilling and tapping for the said screw being carried out while the two members are secured to each other.

Part N is the chuck cap or nut. This consists of a circular mild steel disc, having bored through the centre a hole of corresponding taper to that of the chuck nose. Its rear end is provided with a screwed hole of equal pitch and diameter to that of the chuck body as shown, and the locking and unlocking of the chuck is carried out by means of a "tommy peg" engaging with the radial holes $N^1$.

Parts O, P and Q are the stop blocks, set pins and lock nuts respectively; the object of these being to give the two positive positions of the slide when in operation. The stop blocks O are made from square section mild steel, the ends being turned as shown at $O^1$ and driven tightly into corresponding holes in the fixture body E. These blocks are also

provided with transverse tapped holes for receiving the set pin P. The sequence of operations of this fixture is as follows:—

The slide or chuck plate F is first set over until one of its ends is brought into contact with one of the set pins P. This is positively carried out by placing a setting strip (a block of mild steel correct to width) between the opposite end of the said plate and the adjoining set pin. The chuck plate is next secured in this position by means of the clamping nuts G. The strip is then removed and the work inserted in the

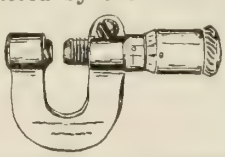
J. R. BROWN & SHARPE, 1872.

chuck ready for the first operation (turning outer cam).

The procedure for the second operation (turning inner cam) is identical with that of the first. The fixture is balanced by means of a detachable balance weight, this being arranged in any convenient manner to suit the exact requirement of the user.

## CONCERNING BROWN & SHARPE MFG. CO.

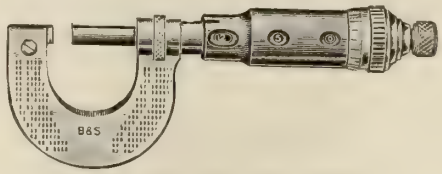
DAVID BROWN and his son Joseph R. founded at Providence, R.I., the business now conducted by the Brown & Sharpe



FORERUNNER OF MICROMETER CALIPER.

Mfg. Co. In 1841 the elder Brown retired and the son conducted the business alone until 1853, when with Lucian Sharpe he formed the partnership of J. R. Brown & Sharpe. The manufacture of steel rules and other precision tools was commenced in 1850. It was during this year that Joseph R. Brown built his linear dividing machine, and it is interesting to note that the original machine is still in use, capable of producing work meeting modern requirements for accuracy, although most of the company's work of this kind is done on machines of later design. Mr. Brown in 1851 brought out the vernier caliper.

Samuel Darling, in 1852, established a similar business in Bangor, Me., and the firm of Darling, Brown & Sharpe, in 1866, was the result of the consolidation of the two interests. One of the important achievements was the development of the micrometer caliper. In 1885 the improved micrometer caliper was put forth and since then its general design has been the same except for occasional improvements which have combined to



DIRECT READING MICROMETER.

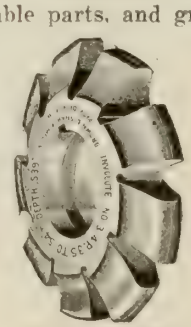
make the present-day instrument accurate, serviceable and trustworthy.

The latest addition to the micrometer line, however, is a radical departure from its predecessors. The direct reading micrometer embodies entirely new features in design which make for convenience and elimination of errors in reading measurements. In stead of dimensions being calculated by graduations the size is indicated in plain figures at openings in the sleeve.

The American standard wire gauge was developed by Brown & Sharpe and was largely adopted by American wire manufacturers. Accurate gauges of the ring and plug styles and double and limit gauges were developed during the early sixties and in the early seventies were placed on the market.

The application of the vernier to the bevel protractor and later the introduction of a universal bevel protractor gave to the mechanical world tools of no mean value, while the addition of various other tools, and improvements and modifications of existing types to meet changing conditions, have always given the company an important position in this line.

The cutter business dates back to the invention of a universal milling machine and form cutters by Mr. Brown in 1861-64. Form cutters with teeth so relieved as to permit being sharpened without changing their cutting contour, marked a beginning in milling interchangeable parts, and greatly simplified



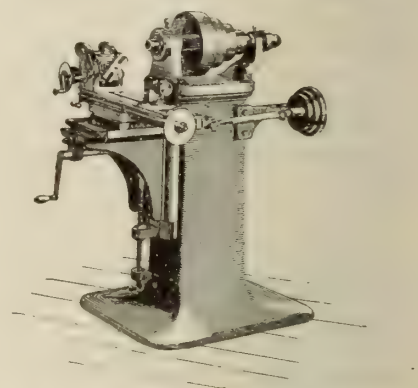
FORM CUTTER.

the problem of economically cutting accurate gear teeth.

B. & S. cutters are a recognized standard. A large department is now devoted to this branch of the business. Experts select the steel for these cutters and only material known by test and experience to be the best for the purpose passes inspection. Special machinery is used for cutting and relieving the teeth. Hardening and tempering are features receiving special attention. The large hardening plant is one of the most modern and best equipped on this continent.

Worthy of some attention is the machinery line manufactured. Over 100 different styles and sizes of machine tools are made. These include plain, universal and vertical spindle milling machines; universal and plain grinding machines; internal, surface and tool grinding machines; screw machines, automatic, semi-automatic and plain; and automatic gear cutting machines. Numerous attachments and accessories for these machines are made.

The factory has an aggregate floor space of 1,058,000 square feet. In 1872



AN EARLY UNIVERSAL MILLING MACHINE.

the total floor area was but 1,800 square feet. The buildings to-day are strictly modern and fireproof, and more than ordinary attention is paid to their up-keep, cleanliness and sanitary working conditions. In safety devices and means for safeguarding employees' health the company can be said to be the leader. An apprenticeship system is in operation which has turned out hundreds of capable mechanics and is regarded as an

B. & S. FACTORY TO-DAY.

ideal plan of industrial training. The employees have a mutual benefit association which has disbursed over $100,000 in benefits.

The Canadian Fairbanks-Morse Co., Montreal, Toronto, etc., are Brown & Sharpe representatives in Canada.

# Series of Practical Questions and Answers for Mechanics

*Every care is being taken to include only pertinent, practical questions, and give same direct reliable answers. Catch questions will be avoided. Arithmetic, consisting of simple addition, subtraction, multiplication and division will be found a useful companion study.*

## LEVERS AND LEVERAGE.

OF all the machine elements, the lever is by far the most used. In fact, it appears in nearly every type of mechanism. Most elementary machines may be reduced to three classes, namely, the lever, the cord and the inclined plane. To the first class belong all arms, pulleys, gears, etc. The second class includes all machines in which force is transmitted by means of tensile members, flexible cords, bands, etc.; and the third class includes every machine that makes use of a hard surface inclined to the direction of motion, such as the wedge or screw.

A lever consists essentially of an inflexible rod or beam capable of motion about a fixed point. The three necessary points of a lever are:—(1)—The point about which it rotates, known as the fulcrum; (2)—the point at which the force is applied; and (3)—the point at which the load is taken. Levers are of three different classes:—(1)—That in which the fulcrum or pivot is between the load and the power; (2)—that in which the load is between the fulcrum and the power; (3)—that in which the power is between the work and the fulcrum.

The principle to be kept in mind in the consideration of all lever problems is that the load multiplied by its distance from the fulcrum is equal to the power multiplied by its distance from the fulcrum. Where several levers are used in series, such as in track scales, testing machines, etc., the arrangement is known as a compound lever, and is still subject to the above general rule.

* * *

**Question.**—A man who weighs 140 pounds desires to raise the edge of a casting weighing 3,640 pounds with a 49-inch bar. Where must he place the fulcrum so as to just balance the casting?

**Answer.**—Assuming that, by lifting one edge of the casting he would be lifting half the weight of the casting, the load becomes $\frac{3,600}{2} = 1,820$ pounds. The ratio of load to power is $\frac{1,820}{140} = 13$, or 1 to 13. That is, the load end must be 1 in length when power end is 13, or the total length of the bar must be 14. The actual length of the bar is 49 inches, and 1-14 of this, or the distance from the load to the fulcrum, is $\frac{49}{14} = 3\frac{1}{2}$ inches.

* * *

**Question.**—In the above problem, if the man had put the end of the bar under the casting an equal amount, what lifting force would he have to exert to accomplish the same end?

**Answer.**—Load multiplied by its distance is $1820 \times 3.5$, and the power arm of the lever, in this case, is its over-all length = 49 inches. Lifting force required is $\frac{1820 \times 3.5}{49} = 130$ pounds.

* * *

**Question.**—The force necessary to upset a ¾-inch rivet hot is 120,000 pounds. The rivet sets of a hydraulic riveter are 40 inches to the one side, and the toggle pins are 24 inches to the other side of the pivot pin. If the cylinder be 12 inches in diameter and the toggle give a reduction of 4 to 1, what hydraulic pressure would be required to do this work?
